Depends on the O/S, but you can get Pc PakRatt for Windows for Windows 3.1
and PKterm '99 for Windows 95/98/NT/2000.

Demos of PKterm are available at the URL below.

Hi
I am still trying to evaluate ritty (still searching for the best RTTY program to use). I must say trying because I can not start the unregistered version of RITTY. My operating system is Windows 98 and I had no problems evaluating other soundblaster based software like MixW Demo.
When I start RITTY the Windows screen switches and the RITTY welcome screen comes on. That is how far I get.....
This is very disappointing as I am very curious about RITTY, I have read many encouraging articles about the software. So if anybody has an idea what could be the reason for my problem please let me know.
Thanks for your help

Hi and thanks for reading this.
I would like to show the sound input to my soundcard on the screen as if the screen was an oscilloscope, but just the part from around 500Hz to 2000Hz. I'm using VB 6.0 and DirectX and have the DirectSoundBuffer accepting the data and I can print it out. The buffer holding the data contains numbers like 22363,29047,-31605,26988,-26736 How do I translate these back to frequency and amplitude of the input signal ? Is this possible with VB/DirectX or am I on the wrong track ? Is there another method I should be using ? My goal, after plotting the waveform, is to write a basic RTTY program then hopefully progress to some other modes.
If someone could point me in the right direction I'd really appreciate it.
Also, if anyone knows how to use the SoundBlaster for DSP or of any websites that have code for any SoundBlaster DSP routines out there I'd like to know where :)

RITTY seems to be DOS based.
What if you start it in DOS mode, not Windows.
Is your sound card working in DOS correctly?
Check it with any old game from the last century....
e.g. Commander Keen.

If you want to go with a decent Windows based RTTY program,
I have had good luck with TrueTTY by UA9OSV. It can be
found at http://ua9osv.hypermart.net/ Like it much better than
RITTY if for no other reason I don't have to shut down windows
and restart in DOS to be able to use it -- I can still use my radio
control program, etc while I use TrueTTY.

Apparently there has been another standard in Europe (I don't have the details handy). This caused some problems recently, as ISDN phones were sold here that had this different layout. It was then used only for the programming of the built-in phonebook, so there was no problem.

Later, these keypad letters became more and more popular, mostly because of GSM SMS but also because the telco started marketing the "name to number" mappings that are used in the USA (of course these were always possible).

This caused a nasty problem: the letters on the keycaps did not correspond to the system in use, and the firmware assumed that keycap layout. They had to upgrade both the keycaps and the firmware to fix this.

Those phones were produced in Switzerland (Eurit), so probably the different standard is in use over there...

One of the SCCA National Pro Rallies is held nearby (the Rim Of The World Pro Rally) and there's been a heavy amateur radio involvement, since the local organizers are both amateurs. It is a great exercise of field operation under less than ideal conditions; the Rally runs on unpaved mountain roads near Palmdale, where the terrain is rough and varies between mountain tops, ridges, valleys and developed areas.

Several years ago, we started using packet radio to relay the entrant scores (actually, start/finish times for each stage of the race) back to a server at the event HQ. This way, the scores were captured in real time, allowing very rapid production of standings. Also, we're likely to spot missing cars much earlier than in the past.

Historically, we've used ARESDATA as the server running on top of G8BPQ; it worked, but we kept wanting some minor (and some not so minor) changes. In particular, we really want to enable 'smart' front-end clients and allow multiple servers to synchronize with each other. Smart clients *could* be built on top of the ARESDATA command protocol, I really want something more sweeping; the first step would be to re-implement the legacy ARESDATA server functionality so I had a source base to work from.

In the month of February, I worked with another local radio amateur (and software professional) and we implemented the first iteration of the RimServer in 100% pure Java.

Database services are provided by a 100% pure Java SQL engine (InstantDB); the server uses the JDBC API. There's a lot to be said for having an SQL engine around even for a relatively simple database.

Since there was no ideally portable AX.25 protocol layer to be found, I implemented AX.25 in Java on top of the JavaComm serial API (strictly speaking, the AX.25 protocol does not care about the underlaying layer, which happens to be a KISS driver on top of JavaComm).

User command processing and console functionality is all written in Java, of course.

I've run the unmodified server on Solaris Intel, Solaris SPARC and Windows 98. Performance is very good; at 9600 baud, the server is still much faster than the radio link. The Win98 system used is an old notebook with a 120MHz Pentium CPU, hardly high-powered.

Considering it is a bit of a science fair project, stability is already quite good, though the acid test will be the actual Rally. There's about 2500 lines of code, and the compiled JAR file is around 55k in length.

We intend to release the source after an interation or two of review and clean-up; while the database server might be interesting, the AX.25 protocol layer is intended to be re-usable and could be the basis of other specialized packet servers written in Java. I believe the implementation of the AX.25 V2.1 specification is very straightforward and compliant and reasonably complete, missing only full FRMR support. At some point, I intend to build this using J2ME + CLDC profile, so that the same AX.25 layer would be used in the smart clients.

As for Java being the way to go, here's a case of where I wanted to build a highly portable server; Java was a key advantage here. Further, JDBC exposes full capabilities of an SQL engine (in my case I'm using a Java SQL engine (InstantDB) which has worked well, but you can select many other 'larger' SQL engines under JDBC). If you're building an application and/or server where run-time portability is key, Java is a compelling alternative to Perl and shell scripts.

Stay tuned, there will be more to come later, probably in May or June, with the eventual posting of the sources to a web page.

1607. Re: starting RITTY

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-09 00:00:00 UTC
From: Rob <Pse@NoEmail.Com>
Message-ID: <f53I4.23128$Xk2.92602@tor-nn1.netcom.ca>
Source record: 13293

RITTY will not run under Windows, not in a DOS box!! Read the DOCS!!

It is best to boot directly into DOS at startup and NEVER let windows load.
RITTY may not work even if you RESTART into DOS mode.

With Windows 98, you just hold down the CTRL key when you first turn on the
computer. Then select COMMAND PROMPT ONLY when the MENU appears.

Then go to the RITTY directory (e.g. cd c:\RITTY) and then execute the
RITTY program.

RITTY is a great program. Version 2.x will doe both RTTY and PACTOR (but
you need a TRUE Sound Blaster Card (not a clone) for Pactor). Any sound
card will work for RITTY.

RITTY version 3.x will only do RTTY. I believe K6STI still sells licences
but you must write to him directly.

If you want a Windows based RTTY program for a sound card, you can try
TrueTTY or MixW32. But neither of them have the ADVANCED DSP features
offered in RITTY.

Good luck.

1608. Terminal programs for old AMT-1 TNC?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-09 00:00:00 UTC
From: Rob <Pse@NoEmail.Com>
Message-ID: <3k3I4.23133$Xk2.92558@tor-nn1.netcom.ca>
Source record: 13294
Cross-posted to: alt.ham-radio.packet,aus.radio.amateur.digital,rec.radio.amateur.digital.misc

Hi,

Does anyone know where I can obtain a terminal program for the old AMT-1 TNC
for RTTY and AMTOR.

The program can be DOS or Windows based. (Windows is preferred)

I think RTTY by WF1B supports the old AMT-1 but I am not really looking for
a contesting program.

Sounds like you're successfully reading the input, which is in the time
domain. If you want frequency and amplitude, try running the data through
an fft. You can probably find lots of references and sample code by
searching for 'fft' in infoseek or some other search engine. Good luck!

Look for a program called "Gold Wave" It will display any type of audio
file as if you were looking at it with an o-scope. It is pretty
flexible and can be tailored to do a lot of different things.

The FFT has been around for a long time. The guys who invented it discovered it almost by accident. They were taking advantage of certain symmetries in the DFT and their FFT was finished in a time so short that they thought they had made a mistake. It works great if you can limit your sample set to a power of two.

One of the gadgets invented at almost the same time, was a
Quick Fourier Transform. The inventor actually formed a
company and built Spectrum Analyzer size (they were big
in the late 60's) display unit. Westinghouse liked it so much
they used it on the AWACS radar that was being built about
the same time. Westinghouse used the name FFT, but the design
was the parallel pipelined QFT design with 2102 static memory :-)
I had an IEEE article on it in my junk stack for many years,
but I think it must be purged. The USAF is just now getting
rid of that radar, and going DSP (signed 8 bit to floating
point in only 30 years)...

I notice there is a new algorithm which is also called a QFT,
but doesn't seem to bear any resemblance.

The FFT underlies a vast portion of the field known as digital signal processing, which is what you've gotten yourself into. I'd recommend the following book as an introduction to the (actually fairly simple) concepts behind the FFT:

Talk about being repetitious! How many times have you repeated
Nikita's riverless bridge quote? Can't you give it up even if
its not all water under the bridge?

Let me add some fresh quotes: -

Government is more than the sum of all the interests;
it is the paramount interest. It must be the efficient,
effective agent of a responsible citizenry, not the
shelter of the incompetent and the corrupt.
--Adlai E. Stephenson Jr. (1948)--

The nine most terrifying words in the English language
are, "I'm from the government and I'm here to help."
--Ronald Reagan (1986)--

It might not take a bigger or better government to make
bigger and better ham exams but bigger and better ham
exams can certainly make smarter and better hams.

--w2ilp--

Hams need bigger and better ham exams,

Your problem is that you do not know the established size limits of a SIG
file. Let alone the established way of quoting messages, replying BELOW
the quoted text, and quoting only RELEVANT portions of the original
article.

Maybe I'm missing something, but I couldn't find
anywhere in the thread where somebody had actually
said that FFT stands for Fast Fourier Transform...

The theory behind Fourier Transforms, continuous,
discrete and fast, is covered in all DSP textbooks.
There is nothing that says you must use an FFT -
except for the O(n log n) running time, compared with
O(n^2) for the textbook definition of a DFT.

One nice cookbook implementation (with discussion of
the FFT algorithm) is in Numerical Recipes in C. YMMV,
as always.

Yes, that and also because the existing packet radio system as poor as
it was, became even poorer as the fanatics who wanted to have control
over *their* bbs systems fought to belittle those of us who wanted to
incorporate high speed rf connections with some parts that could not
be connected with RF in a practical manner, connected via the
landline/RF system of the internet.

My position was that if we did not promote high speed local systems
with various interconnects to connect the high speed locals, we would
be completely preempted by the internet. There was a very loud and
extreme minority who fought this concept.

They won.

And packet for all practical purposes is no longer a serious way to
send traffic.

Now we use the internet which is a part RF and part landline system.

>I would suggest to allow entering all ham bands to as many computer

>operational systems, excellent written english and similar. Why not?

We have had that in the U.S. for many years with a vhf and up
Technician class license that has full priveleges on the bands above
HF and requires no morse code requirement.

There is very little that can be done on HF for a serious high speed
traffic handling system that has not been done already depending on
how much bandwidth you are willing to use for a given amount of data.
All high speed digital will have to use the bands above HF.

Sincerely,

Rick, KV9U

And in fact the Land Line Lids did exactly what you described above,
with one difference: they never built any high speed local interconnect.
So the entire RF portion of the network died out, because ALL the
traffic went FIRST over the internet. It IS faster. The RF network carried
no traffic. It died out. With no traffic to carry, hams were just not
interested in building RF network, because it would not be used.

It's the law of unintended consequences. The idea sounded really good.
Then it was tried in Texas, and the result was the demise of the
Texas RF network. By the time anyone noticed, the rest of the RF
network had already been bypassed by internet links.

The ONLY interesting thing about the RF network is that it is Ham Radio.
The internet isn't. You take away the RF part, and (big surprise!) Hams
are no longer interested in building it.

Yes. Packet Radio is pretty much dead.

There's no sense pointing fingers, while both sides can blame each other,
the fact is, it really doesn't matter.

Anyone interested in broadcast/net control as a new development?
VHF, or HF. New for Ham packet that is...

Suppose you had a net control station (NCS) that transmits 32 bytes, listens
for new participant units (PU), and cycles through each of them by polling.
New PU's would send a slot request, and the NCS would add the PU.

The cycle would be: NCS, listen, NCS, listen
The NCS would just send 32 bytes of whatever is in the queue, and if no PU's
want to transmit, they just listen and gather up the data.

Another cycle: NCS, listen, PU Request, NCS PU sequence number issue,
listen, NCS, NCS Poll PU #n, PU #n sends 32 bytes

With a PU time-out feature, stations that fade out lose their slots, and the
more
PU's there are, the longer it takes to transmit all the data.

The nice thing, is there is one master, and slaves are given a small PU number
rather than huge 32 or 56 bit addresses. Callsign ID for each PU can be passed
to every new PU as the first data.

There could also be passive PU joins. The PU sends a passive request with
their lat/lon, etc, and the NCS only polls them every 30 minutes or hour to see
if they still exist.

The question may arise: "what about two masters in site of each other?"
Answer: It won't work. You need alternating freqs with a common backbone
(HF would work).

A form of multicast, using old Navy technology...

For Linux, there are soundcard modems built into the kernel.
Look for the ax25-howto on the linux.org site. Basically,
you need a pretty generic Sound Blaster compatible card, or
a Crystal/Windows Sound System sound card for this to work.
I use this currently for 1200 baud, and it's pretty easy,
if you're comfortable with building the kernel and all that.
(Which is something to learn, if you're going to be messing
with Linux anyway.) Right now, the Linux drivers talk
to the soundcard directly rather than going through the
sound drivers -- which is kind of klugy (Maybe there's
a reason for this, I don't understand.).

For Windows, there's SV2AGW, and his website seems to be
down, but you should be able to find that software somewhere.
It works pretty easy, actually, and supports near any
soundcard. I have used and registered this software,
and it is pretty easy to get working, if you poke around
with the options. I use this at 9600, but I suspect that
I have too high a bit error rate on 9600B sending with my
soundcard, and am thinking of switching to YAM or maybe
Baycom for 9600 with my remote system. I seem to be able to
receive good, however. (And, mostly I just check
mail, so I only type short commands.)

Also, Flexnet supports soundmodem, but me, I have no
experience with this. I believe Flexnet is basically
DOS, but works fine under Windows. (Right?)

I don't think there's much of anything for SPARC, for ham
radio. Most of the people writing ham radio stuff,
seem to be either on Linux, or DOS/Windows.

Do any NOS variants support sound card DSP? I haven't
touched JNOS in awhile, but I don't recall it having

any soundcard stuff in it.

This is about the same protocol as the pacsats have used for about 10
years... the directed polling (instead of a general invitation to join)
has been suggested by Jeff in the early days, but I don't know if it ever
got implemented. So, at every invitation there is a storm of attempts to
join. Luckily the system operates fullduplex so this does not bother the
information sent by the broadcaster. The protocol could work on a
halfduplex channel, but would badly suffer from that problem.

Now if i understand well..

just by using a sound card to "record" packet from a radio..... i can decode
it???
and the inverse would be true..(sending from my radion sound created by my
card that would be enough to make some packet???)

now i would just have to use a pin from my printer port to creat the signal
needed for my ptt...???

is that true???just can beleive it can you explain a bit more?

Thanks

1632. ALE-like digital modes?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-12 00:00:00 UTC
From: mikebo@Mars.mcs.net
Message-ID: <8d2cgf$s4e$1@Mars.mcs.net>
Source record: 13218

I just recently discovered digital modes on HF. It's fascinating, and since I started running PSK31 and Hellschreiber, I haven't picked up a microphone or key... but I digress.

I don't know why, but I'm fascinated by the sound produced by the ALE (Automatic Link Establishment) HF radio protocol. I'm wondering how the tones and sequencing used in this protocol were picked. Also, if this group of tones and sequencing is so resistant to fading and interference, perhaps it would make sense to develop a digital mode using the same type of signal. Has anyone heard of such an effort?

Comments?
73, Mike, WA9CQ

1633. Questions on operating PSK (and other digital modes)

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-12 00:00:00 UTC
From: mikebo@Mars.mcs.net
Message-ID: <8d2ede$11jl$1@Mars.mcs.net>
Source record: 13219

OK, I'm very new to digital modes. I recently start using DigiPan on PSK31 and I'm having a blast with it. I also have been playing with Hellschreiber, but it is clearly not as popular as PSK31. Finally, I've never heard anyone using MT63 at all - maybe I'm not looking in the right place for traffic using these modes.

Anyway, I have some questions regarding operation on digital modes...

1) I have a list of suggested operating frequencies for PSK31. Are there lists of common operating frequencies for Hellschreiber or MT63? Also, I seem to only find digital modes in use on 10m or 20m. Is this typical?

2) When operating in digital modes like PSK31, Hellschrieber, MT63, etc. what kind of ID is required? I've heard some stations tack a CW ID on to the end of their transmissions, but most do not do this. I believe that according to US FCC rules, we should ID in the same mode in which we're transmitting. However, different countries may have different rules... comments?

3) I've heard a lot of stations being preoccupied with RST signal reports, but do these really apply to narrow band digital modes when there are multiple stations transmitting simultaneously? How can you discern which of several signals is stronger/affecting your S-meter the most at a given time?

4) I've noticed that in PSK31, the QPSK mode is MUCH more reliable, yet the majority of weak signal DX coming in is using BPSK, and is therefore garbled and largely unintelligible. Why don't people use QPSK by default when calling CQ DX? Seems like the sideband issue is moot since the guideline is USB above 10MHz and LSB below.

Any comments would be appreciated...

Hmm, so nothing to do with tennis then :(
Seriously, I've just dug out my "Numerical Recipes in Pascal" Cambridge University Press (last time opened over 10 years ago) and like the "C" version, it has a whole section on FFT (75 pages). That should get me going. I'll probably pop back to get the answer to "how do you know where the data bits start and stop in the signal?". That seems to be the next hurdle after getting the signal, but I estimate that I won't need that answer for about 6 months!
Thanks to all for the help. Colin MM5AGM (a lot older than the callsign indicates)

Actually you don't need an FFT for most digital work. The FFT converts the signal from the time-domain to the frequency domain. Might be good for filtering, but you really want to work in the time domain to demodulate and output the data. When's the last time you needed a Spectrum Analyzer to look at the computers serial port, for example. An O'cope (time-domain) is really what you want.

In this case you want to look for the frame sync to start your data decode.

The FFT of course is excellent for modems that use a separate I and Q channel (QPSK, etc, more sophisticated signals). Don't know if that's where you're headed.

Yes. The soundcard, coupled with the processing power of the CPU on a PC,
has the capability to encode/decode 1200/9600 baud FSK. All you need is
an audio cable from

Radio to PC
--------- ---------
speaker out line in,
mic input line out,

a ciruit on either the parallel, serial, or MIDI port to control the PTT
on the radio, and finally the soundcard drivers and software to interface
with the hardware. The software is highly dependent on timing and
therefore is best used with DOS, Win95, or Linux. Win98 and WinNT have
multimedia specific timing issues so they are not good platforms for
soundcard TNC's.

I just configured my computer with the FlexNet soundcard modem
drivers/modules, and am now receiving packet for the first time (I'm a
packet newbie!!). I still need a four connector plug for my Yaesu HT
before I can complete the PTT circuit and send (everyone breathes a sigh
of relief). FlexNet is freely available for amateur use. Check out

http://home.pages.de/~flexnet/

for software downloads, detailed instructions, PTT circuits, and both DOS
and Win95 configurations. DOS mode drivers are loaded on bootup, but
Flex95 virtual device drivers take over when Windows starts. A new
Windows "Hardware profile" will have to be created with the Windows sound
card and port (LPTx, COMx, or MIDI) drivers disabled so that the FlexNet
soundcard and port drivers can load on boot-up. You will need to download
the following files:

pcf.zip DOS flexnet kernel and utilities
flex95.zip Win95 vxd's (requires DOS mode drivers)
sm.zip sound card drivers and utilities

and flex95ip.zip TCP/IP drivers (optional)

You will also want the following terminal software from www.baycom.de

bct161.zip BayCom packet Terminal software
help_en.zip help file for BCT (english) or
help_de.zip (deutsch)

The only wiring required is a simple circuit for PTT, depending on the port used. Diagrams are included in the above website. Total parts costs less than $10USD. Apparently, FlexNet is a modular system that interfaces with many types of hardware drivers (TNC's and sound card modems) and application software (terminal emulators and BBS's).

You can also get a reprint of the article "A $10 Packet Station" by Don Rotolo (N2IRZ) from the December 1999 edition of CQ-VHF (now defunct) which described the soundcard packet modem and turned me on to packet. FlexNet is further described in the June, 1997, column "Digital Data Link." See

http://www.cq-vhf.com

Thank you FlexNet group for making this software available! I sure would like to see more discussion on FlexNet so I can find out more about how the node/digipeater version works and compares to ROSE, NET/ROM, etc.

Wierd. Flex95 which runs under Windows95 loads FlexNet on boot-up in the config.sys and autoexec.bat files, but when win.com starts FlexNet automatically loads virtual device drivers. Are these 16-bit real-time DOS mode drivers, or 32-bit Windows drivers? Anyone??

Hello Mike,

As far as I know, many years ago the U.S government asked industry to develop a more advanced ALE system than was currently available. A number of manufacturers put forward ideas and MITRE was asked to adjudicate. In the end I believe they decided on a hybrid of the best suggestions.

The ALE protocol is not that robust, more modern modem systems based on highly redundant PSK waveforms perform better. In fact some H.F manufacturers have complained that their MIL-STD 188-110A modems will operate at 75 baud on channels that ALE will not even establish links on.

The waveform is fairly easy to jam and is definitely not an LPI system due to its obvious waveform and long call setup times (10 - 20 secs).

Whether operating a relatively slow speed data mode that occupies an entire voice bandwidth on the Amateur bands is a good thing or not I will leave to others to comment on.

But for what it is worth, my on air tests indicate that the ALE DBM mode appears quite robust, most of this is due to the long interleaver depth used in both Basic and Extended mode and of course the Golay coding.

Both, AFAIK the drivers are implemented for DOS, but there is a vxd
which propagates interrupts realtime down into dos-mode. I guess this
was the easiest way to do Windows support without having to rewrite
dozens of drivers. There is a pure 32-bit Version of FlexNet in the
works, though. Gunter showed it at this years Darmstadt PR Convention
under W2K, it seemed to work quite well, although lacking some drivers
until now.

1645. Re: Questions on operating PSK (and other digital modes)

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-13 00:00:00 UTC
From: Den <dennis.spiess@reckitt.com>
Message-ID: <8d4flq$8l2$1@nnrp1.deja.com>
Source record: 13231

I am rather new to PSK but have done a lot of research. Most of your answers can be found on the web. Search PSK31.
I'll tell you what I know:

> 1) I have a list of suggested operating frequencies for PSK31. Are there lists of common operating frequencies for Hellschreiber or MT63? Also, I seem to only find digital modes in use on 10m or 20m. Is this typical?

See www.kender.es/~edu/frequencies.html for PSK frequencies.
I have never worked any of those other modes.... why bother?
PSK seems to be the answer on HF!
I agree that 10 and 20 are most widely use. Would like to see it get onto 30M.

> 2) When operating in digital modes like PSK31, Hellschrieber, MT63, etc. what kind of ID is required? I've heard some stations tack a CW ID on to the end of their transmissions, but most do not do this. I believe that according to US FCC rules, we should ID in the same mode in which we're transmitting. However, different countries may have different rules... comments?

From what I understand you do not need to CW id. So long as you send your call every 10 minutes and at the end of the xmission in PSK then you are legal for the US which is what matters here.
I do CW ID if I am tuning and adjusting.... without the PSK ID you must ID... if you have been tossing out a crrier, adjusting levels etc, then the old CW is needed every 10 minutes and at the end of the tuning.

> 3) I've heard a lot of stations being preoccupied with RST signal reports, but do these really apply to narrow band digital modes when there are multiple stations transmitting simultaneously? How can you discern which of several signals is stronger/affecting your S-meter the most at a given time?

I have not found thes to be the case. Most stations I have worked do mention how well they copy. If they do send an RST it is just a gage to use.... PSK does have a Readbility and Signal strength... the Tone part is questionable.
Yes, the S-meter doesn't show much ...
What I do find important is to watch the width of the received signal and comment if it is very wide and splashing. PSK is a mode where you should turn down the power. No need for 100 watts when 25 will do!

> 4) I've noticed that in PSK31, the QPSK mode is MUCH more reliable, yet the majority of weak signal DX coming in is using BPSK, and is

therefore garbled and largely unintelligible. Why don't people use QPSK
by default when calling CQ DX? Seems like the sideband issue is moot
since the guideline is USB above 10MHz and LSB below.

Yes, QPSK is not used. I have never used it, or found someone who has.
Perhaps on the next poor contact I will ask the other end to switch.
I have worked a few DX stations, all PSK, not QPSK.
From what I see it is always USB for PSK on all freqs.

Take a look at the WinPSK programs: WinPSK is single receive, WinPSKse
is dual receive. I likje them both.
Hope to work you on PSK....
Encourage PSK for FieldDay 2000......

2-meter RTTY used to be fairly popular. In south Texas a VHF RTTY BBS
existed prior to the introduction of Packet Radio.

Lately I've heard of Hams using PSK31 on 2-meters. I haven't heard of anyone
using RTTY on 2-meters for quite a while, but there's certainly nothing
wrong with trying it out, if it interests you.

Good luck!

Hello Floyd,

The cable shipped with the DSP-RTTY program is a standard modem cable.
Replacements are $9.95 from Timewave.

I have tried switching between BPSK and QPSK. Overall, I've never seen
any significant difference. Tuning on QPSK is more critical.

Well, if it loads into config.sys and autoexec.bat, it
is DOS -- though, really, as long as it works,
I don't know what difference it makes. Judge these tings
on their on-the-air performance rather than what
operating system they're on -- is my thinking.

It is still a pity that he doesn't do Linux...
In that environment you don't have to "rewrite" drivers because the
number of bits has gone up :-)

But seriously, Linux could use a good AX.25 implementation, and lot of
effort on emulating Flexnet could be saved by having the original thing.

(our node sysops are converting their PC systems from DOS to new
technology, and of course most prefer Linux over Windows. A Windows
version has more of a place at end-user stations, that don't need the
router anyway and can just as well use SV2AGW's software)

Now I really am getting confused ! I have the data from my soundcard and it's a load of integers from -32000 to +32000. This data was "collected" in a buffer array used by a windows directx call (I'm sure I saw something about it being PulseCodeModulation). I thought I needed to convert this back to frequency and amplitude in order to "see" it. I think I need to go away and read a lot more to get the basic principle in use here. My original intention was to try and decode a simple mode like RTTY, then look at digital filtering to improve the reception. All programs would be freeware as is usual for my amateur radio stuff.

http://wkweb5.cableinet.co.uk/MM5AGM

original plan
1) Get data from soundcard (done it)
2) Show data from soundcard on screen in scope type display to prove to myself that the numbers add up and to help with the design of a tuning aid.
3) Look at decoding algorithms (dig out Tanenbaum computer networks book - bound to be a starter in there)
4) Decode RTTY (this looks like the easiest to start with)
5) Add digital filters to RTTY receive program
6) Add transmit routines (this bit should be the easiest)

Jack,

For a really cheap RTTY TNC, just build a HAMCOMM interface ($20 US max) and use the HAMCOMM software. It will also do AMTOR.

Hamcomm works great especially if you put an external SSB audio filter in front of the HAMCOMM interface.

FYI - You can also use the HAMCOMM interface for SSTV with great programs like EZSSTV, JVFAX etc.

Another appraoch is to use the sound card in your computer and use TrueTTY for Windows or MixW32 for Windows. Both do a great job on RTTY.

I believe TrueTTY is the least expensive approach especially if you don't want to build a HAMCOMM interface. (The performance is also likely better than the HAMCOMM approach but you won't be able to run AMTOR or SSTV!)

For RTTY, it is unlikely you will see much difference between a good sound card RTTY program and an external RTTY modem (and is a lot less expensive!)

But if you want to run PACTOR, you will likely have to buy an external multimode controller for RTTY, AMTOR, PACTOR etc. To my knowledge, if you want to use your computer sound card for Pactor and RTTY, you must run Linux (or have an old PSA sound card which aren't made anymore if you want to use Windows)

If you go to the Intel web site under the developer section they have
a bunch
of routines that manipulate sound card data on a PC. Try
http://support.intel.com/support/performancetools/libraries/spl/index.
htm
as a starting point. Their standard stuff shows some basic ways to get
data in and out of the Windows sound card.

Next step is to write the code for a FSK demodulator. RTTY signals are
typicaly sent with one tone representing a one and another tone
representing
a zero. You have to recognize the tones and convert that information
to
ones and zeros.

After that you can add DSP type stuff to clean up the tones before
they get
to your demodulator.

Hope this helps.

Bob

Oh yes, I almost forgot about RITTY by K6STI. RITTY is a DOS program that uses you sound card for RTTY. (The older versions 2.xx also supported PACTOR. PACTOR was dropped in version 3.xx)

RITTY is an outstanding program with some advanced RTTY features. I would recommend RITTY over the vast majority of external RTTY modems on the market and is typically a lot less expensive.

If you are interested, write to Brian K6STI and ask whether he still sells licences for RTTY.

I think that the key to your confusion is the last sentence, above.
You are not converting "back to frequency". Your original
collection was in the "time" domain, not the "frequency" domain.
These were amplitude samples over a period of time. Now that
you have the data however, you can:

1. Convert back to "time" and amplitude, or

2. Use an FFT, as the other posters suggested, and convert
to "frequency" and amplitude.

Converting back to time and amplitude sounds like what you wanted
to do. Your original post talked about an oscilloscope type of
display. An oscilloscope displays in the "time" domain. A
spectrum analyzer displays in the "frequency" domain.

I think your original intention is still good. You just have to
decide how you want to attack your data. In the "time" or
"frequency" domain. It can be done in either dimension. There
are several CW/RTTY programs already out there that use an FFT for
doing the filtering. With the new faster computers, the FFT is
becoming more and more practical.

If I can be of more help, email me at the address below. I won't
be able to get at my Deja account for a few days.

What your buffer contains is the time domain data sampled by the sound card.
You can 'see' it now, but what you're looking at is data in the time domain.
Each value in your buffer is proportional to the voltage sampled by the
sound card at that instant in time. For example, if your sample rate is
11025, the value at buffer[0] is proportional to the voltage at time 0, the
value at buffer[11025] is the proportional to the voltage at time 1 second,
and so on. If you played a 10 Hz sine wave into your sound card while you
were capturing data, and then plotted the buffer on the screen with
buffer[i] on the y axis and i on the x axis with i going from 0 to 11024,
you would get a nice picture of 10 cycles of a sine wave (sorry if you
already know this).

To decode RTTY, you want to determine when a 'mark' tone is being received
and when a 'space' tone is being received. Once you know that, it's fairly
trivial to determine when a start bit occurs, what character was just
received, etc.

One possible (and very inefficient) way to determine when these tones are
being received is to convert your time domain data to the frequency domain
using an FFT. You can then tell how much energy is present at the mark
frequency and how much is present at the tone frequency. If you do the
FFT's at a fast enough rate, you can see all the transitions from mark to
space and back, and use that to decode the RTTY.

I say inefficient because the FFT also determines how much energy is at a
bunch of other frequencies that you're not interested in. Instead you could
use the Goertzel algorithm or correlation, both of which can be used to find
the energy in a specific frequency range. The FFT would still be useful to
display the audio spectrum as a tuning aid, and you would only need to
update that a few times a second.

This would be true if the radio output was nice clean digital data, like a serial port. Since it's analog audio, with noise and different tones representing the binary data, the frequency domain can be an easier domain to work in to determine when a mark or space tone is present. Once you know that, you can switch back to the time domain (mark energy vs. time and space energy vs. time).

Yup, the AGW site is down - for now. George is on the hunt for a new server.

Until he gets a new server going, you can see a copy of his download page on my web site (including the software!). Visit either the APRS or Packet Radio pages - you'll see it. URL is below in my sig block.

The software has also been uploaded to the TAPR FTP server - don't know if it's been moved out of the incoming directory and is visible yet or not.

I am rather new to PSK and have been enjoying the mode. I have found
that with the programs I have tried a loud station in the band pass
will push the AGC down and lower the copy rate of weaker stations.
Somtimes making copy almost impossible.

My DSP helps but is a pain to keep tuning it when a loudie pops up.

Any ideas out there?

I have used WinPSK, WinPSKse and Digpan.

Try www.geocities.com/ae4jy/files/winpsksrc11.zip which is a set of sources
for WinPSK, (which is a full MFC app which can talk to the sound card).

Just for the record, there is at least one program which does Pactor
and RTTY and runs under DOS using a soundcard: RITTY by K6STI.
Unfortunately, Brian no longer sells or supports RITTY, but if you can
purchase a copy somewhere, it is a terrific program. Brian abandoned
it when a number of stations made illegal copies and used them on the
air. I don't know what the copyright restrictions are, and perhaps
purchasing a copy from a second party is illegal too, so tread
cautiously. The program was somewhat expensive - $150 - but worth it,
in my opinion.

You need a narrower bandpass filter in your RX. Depending on your rig, a 250 Hz filter would be great, but not all rigs allow you to select such a narrow filter while in SSB mode. My TS-870S has a built-in 50 Hz filter, but only available in CW mode. I can listen to PSK with perfect copy, but can not transmit. I have written to Kenwood asking them if there is any way to use the 50 Hz filter on SSB, but no response yet. If that were possible, the TS-870S would be a near-perfect PSK rig.

OK, well... as I suspected, it sounds like it wouldn't make any sense.
I was not aware the ALE signal consumed over 2KHz bandwidth to get a 75
baud data rate... MT63 does a lot better than that (100 baud from 1KHz).
I think I'll stick with PSK31 & Hellschreiber for now. ;v)

I have heard some interesting signals on 20m lately that I cannot I.D.
One is a four-tone PSK signal appearing nightly around 14.080 - 14.100.

Thanks for the comments.

Hello everyone. I saw the postings which read:

1) "But if you want to run PACTOR, you will likely have to buy an external multimode controller for RTTY, AMTOR, PACTOR etc. To my knowledge, if you want to use your computer sound card for Pactor and RTTY, you must run Linux"

2) "Just for the record, there is at least one program which does Pactor and RTTY and runs under DOS using a soundcard: RITTY by K6STI. Unfortunately, Brian no longer sells or supports RITTY, but if you can purchase a copy somewhere, it is a terrific program. "

Take a look at http://www.bartg.demon.co.uk (yes, the same BARTG as in the HF RTY contest) and have a look at the BMKMulty software which has a PacTOR mode. Like RITTY, BMKMulty runs under DOS.

73, Ian.

Tried that but couldn't make it work. It would work if I could get the frequency split exactly right. For instance, lets say the dial reads 14.070 on the A vfo, which is on CW. Since my BFO offset is 800 Hz, I get an 800 Hz tone when the other guy is transmitting on exactly 14.070. The problem is how do I transmit on exactly 14.070 in either USB or LSB mode? The software I'm using (DigiPan) will output a tone of exactly the same frequency I'm receiving, 800 Hz. So in order to transmit on 14.070 using an 800 Hz tone, I would have to set my B vfo exactly 800 Hz higher or lower (depending on which sideband). The problem is how do I set it EXACTLY 800 Hz higher? The dial readout is to 10 Hz, so I can get close, but 10 Hz is pretty far off for PSK. And of course, I would like it to track automatically when tuning up and down the band. With this procedure, I'd have to reset it manually every time.

Actually, the best way might be to zero the A and B vfos together and then use the XIT to introduce an 800 Hz offset, but the problem remains of getting exactly 800 Hz. And of course, whenever you zero both vfos, it changes the both of them to the same mode, so you have to manually change the B vfo back to SSB while leaving A on CW.

Obviously, if the '870 were designed for PSK in the first place, the world would be a better place to live. :-)

Am I missing something here? Please let me know if you have a better way. Thanks.

1682. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-15 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <8d8ql4$5oj$1@news.hawaii.edu>
Source record: 13168
Cross-posted to: rec.radio.amateur.dx,rec.radio.amateur.digital.misc

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6O, jeffreyh@hawaii.edu, or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any amateur radio-related message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the

group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas. PLEASE BE SURE TO SAVE THE WELCOME MESSAGE YOU RECEIVE AFTER SUBSCRIBING -- IT WILL CONTAIN IMPORTANT INFO REGARDING UNSUBSCRIBING!

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send an email to cq-contesting-request@contesting.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's

headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

No, You need more than just firmware. You need some hardware too!

Check out the TIMEWAVE web site -- www.timewave.com. Timewave bought out AEA.

Depending on your model of the PK-232MBX, it will cost you between $129 and $159 US to upgrade the PK232 for PACTOR. (You will also have better DSP filters too for RTTY etc). It is not a cheap upgrade.

You see many HAMs selling PK-232 and PK-232MBX on Ebay at a discount due to the high price to upgrade it for Pactor.

PACTOR is very popular. You rarely hear AMTOR these days. If you want to get on PACTOR, pay for the upgrade. Or just get rid of the PK-232MBX like many HAMS have done on EBAY and buy a KAM (with PACTOR and GTOR) or better yet buy a SCS PTC II (with PACTOR 1 and PACTOR II --- PACTOR II is amazing).

Good luck

Rob

For a great FREE terminal program that works great with the PK-232 (or the KAM etc), check out LOGGER.

Despite its name, it has a great data terminal that works great with the PK-232, KAM etc. It has split screen, message buffers etc. It also logs QSO's

LOGGER is free. Go to www.itis.net/logger

Doesn't need any fancy software, any terminal program will work but try
Xpwin, works great and you get 99 free goes before you need to register.

The EPROM issued on or after May 1993 (9305) had Pactor, any older than
that and you'll need to contact Timewave for an upgrade, see their Web
site, they also do a DSP front end upgrade.

1694. 500 Hz Filter with Pactor II?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-15 00:00:00 UTC
From: Seth Miller <sethmiller73@email.com>
Message-ID: <38F8E929.FB3A9D69@email.com>
Source record: 13180

Can anyone suggest why I see a lower throughput with Pactor II when using a 500 hz IF filter? I am carefully centering the passband within the filter, etc., and I observe no degradation when receiving RTTY or Pactor I signals, but when receiving Pactor II there is a slight, but noticeable, reduction in throughput when using a 500 hz filter (vs. the stock 2.1 kHz SSB filter set). As far as I know, a Pactor II transmission should should fit within a 500 hz bandwidth... am I missing something? This is not a major problem since the PTC-IIe seems to be able to ignore virtually any interference in the audio passband, but it would be nice to be able to use the narrow filter for those rare occasions when I need to keep an adjacent signal out of the AGC, etc. I thought perhaps a lack of linearity in the filter might be the problem, but there doesn't seem to be any detectable defect when using the filter in any other mode, and the passband looks quite flat when looking at white noise on a audio spectrum analyzer.

Equipment is an Icom 746 with a FL-52A (500 hz filter for the 455 IF) and an SCS PTC-IIe TNC.

Thanks for any input -

- Seth N6BMB

1696. Using ALE in the Amateur Service --

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-15 00:00:00 UTC
From: Patricia Gibbons <wa6ube@tactical-link.com>
Message-ID: <8db8skqdd1@slb3.atl.mindspring.net>
Source record: 13182

Hello Michael ... Dudley Emer, KK7IF, and I have been experimenting
with ALE within the ham bands over the past several days.

I have a Motorola MICOM-2R with ALE, and Dudley is using two different
types of systems.. One is Charles Brain's ALE software via a SoundBlaster
card, and another is a commercially available ALE modem, from Fredrick
Electronics,
that is outboard from the radio...

We are still working out some bugs, but it is an interesting learning curve,
seeing
how ALE works, trying link-quality exchanges, and sending short
"orderwire" messages via the AMD (Automatic Message
Display) that is part of the ALE protocol.

The ALE modem is an "8-ary" type that uses 8 discreet tones within the
passband
of a standard SSB voice channel.

Data interleaving is used and characters are sent three times through the
modem,
each time using a slightly different selection of the 8 tones, this allows
for successful
reception of a message even if one of the tones is suffering some
interference..

The ALE protocol is not really meant to actually send long messages, other
than what would be called a "page" or an "orderwire" message.. Short,
"Automatic Display Messages" (AMD's) are part of the ALE protocol..

The reason that ALE is used only for managing channel assignments
between radios, sounding messages, "link-quality" reports between radios,
and AMD messages, is that the protocol has a lot of redundancy in it which
means
it has a relatively slow throughput. The amount of data actually being
exchanged between
radios is relatively little..

ALE is good method of having the radios themselves managing a net,
which is made up of specific radio channel assignments and net members.
Once linked to a station, other protocols for digital communications
are better, for actually passing traffic, such as Pactor II, Clover, Gtor
.. etc ..
and an outboard SCS-PTC II(e), Kantronics KAM-98, or other type
of modem would be preferred for actually passing traffic..

If you are on the U.S. west coast, you are welcome to join us.. We've been testing
ALE signaling on 3996 KHz, USB , and 7296 KHz USB..

Note that there is some "quirkyness" in using ALE in the hambands since there are specific rules in place for station identification. I've queried the FCC
about this issue and they have no problem with ALE in the ham bands other than using it in a segment that allows for the amount of bandwidth required (this means a voice-channel), and complying with station identification requirements.. Automatic sounding messages, even if using your amateur radio callsign as the ALE ID, could be a problem with the FCC since Part 97 requires station ID via voice or CW ..

I would rather have a situation where the ALE ID, being an amateur callsign, would be accepted as a valid station identification, since the ALE protocol is an open standard, recognized by the Federal Government, and the use of the ALE protocol is not being done for the purpose of obscuring a message..

In-depth information on the ALE protocol can be found
in the book:

1699. Re: 500 Hz Filter with Pactor II?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-16 00:00:00 UTC
From: Bob Camp <bob@cq.nu>
Message-ID: <GE7K4.705$kb2.5940@news02>
Source record: 13185

A couple of thoughts:

1) not all 500 Hz filters are 500 Hz wide. You might want to check and see
if yours is maybe a little on the narrow side. A 450 Hz wide filter might
have an impact.

2) Filters have delay variations within their passband. A narrow filter
will generally have more delay variation over a 500 Hz region than a
wide filter will. Delay variation may have a slight impact on Pactor.

I believe that you will find that voice or CW ID is no longer a
requirement on a data mode, even in the phone portions of the band. ID in
the signaling mode in use is adequate, per the FCC.

Well if it's your receiver that's applying the AGC you need a narrower IF filter in the receivers IF stage, unless you can vary the IF bandwidth in your RX (some receivers have IF-shift for doing this) i can't see a way round it, unless you use PSK software that does this for you after the 31.25 baud narrow filter in the software - not sure which PSK programs do it (if any).

Hello John,

You've got it. version 7.2 upgrades any MBX for Pactor, gateway and GPS for $50. The DSP upgrades will improve operation with weak signals and in crowed bands. If you are a RTTY op its a must.

Yeah, I'm gonna have to get those din plugs from a Ham Store somewhere down the road, the 950sdx I'm getting don't have them with it, it's from a estate sale of a freind of mine, who became a silent key, and they (his family) have no clue about ham radio and where the acc's with the radio went to. also, while I got everyone's attention, anyone know where I can get a RM-1? Kenwood says those aren't available as parts anymore. (which sucks out loud in my opinion!)

Source record: 13192

Hi Seth,

Actually, my I do not notice any reduction in performance using PACTOR II with my 500 HZ cascaded filters in my FT1000.

But I think these 500 HZ filters in my rig are a little on the wide side. I am able to work CLOVER without any problem using these 500 HZ filters (even though HAL does not recommend the use of 500 Hz Filters for CLOVER since 500 HZ filters typically REDUCE the performance of CLOVER due to its bandwidth. Another reason why PACTOR II is generally a better mode!)

As pointed out many 500 HZ filters are either a little wider or narrower than 500 Hz. I suspect that your 500 Hz filter is a little on the narrow side.

Hi Ian,

Please correct me if I am wrong but I think the BMK-MULTY software requires an external old modem that will decode the mark and space signals and send them to the PC where BMK-MULTY does the PACTOR decoding etc.

How do you like BMK-MULTY? Does it works well?? What type of external modem are you using?? A homebrew or an old HAL type modem??

I have a DSP-599zx audio filter with a build in RTTY modem but the modem is only designed for speeds up to 75 baud or so. It may work on RTTY and AMTOR with BMK-MULTY. But I doubt it would work on PACTOR with BMK-MULTY. Too bad!

Colin,
You have what you need to display the data as an O'scope would.
You have the data points and the sample interval(1/(SamplesPerSecond);

You decide on your resoultion, say display a total of .5 seconds of
data, with a sampling rate of 1Khz (low rate, but easier to calculate).
That means that each data point is .001 seconds apart. These then become
your 500 sets of x,y pairs, scaled ofcourse, for what ever
graphng/display method you are using.

Data would be:
x y
0 1st element of data array
.001 2nd element of data array
.002 3rd element of data array
and so on...

It appears that most PSK software have AGC built in... I do not think
it is the rig. I use WinPSK, WinPSKse and Digipan... Just watch the
water fall when a loud station comes into the bandpass. Everything else
goes way down. Using the rigs narrow CW filter in the SSB mode sure
helps... Thanks for the suggestion someone posted. My rig does allow
this (TS440).
Switching in the filter is easier than continuously retuning my DSP.

Black Cat Systems (http://www.blackcatsystems.com) has released version 3.2.1 of MultiMode, a program for amateur radio operators and radio hobbyists that allows the transmission and reception of morse code, slow scan TV, and other modes.

The latest version of MultiMode fixes a small bug that could cause a short pause when the mouse button is clicked.

MultiMode is shareware, and may be downloaded from the following URL: http://www.blackcatsystems.com/software/multimode.html

MultiMode is a shareware application which allows your Macintosh to decode and transmit several different modes of non-voice communication often heard on shortwave and ham radio. It is the only program of its kind for the Macintosh,rivaling commercial packages for the PC platform costing hundreds of dollars. It is ideal for amateur radio operators, shortwave radio listeners, and other radio enthusiasts. MultiMode is localized for for Dutch, French, German, Italian, and Spanish, in addition to English.

MultiMode allows you to decode and display morse code, RTTY, FAX, SSTV, ACARS, and many other modes on your Mac, without any extra hardware. MultiMode now also allows you to transmit in most of the modes of operation.

In the past, dedicated hardware, often costing hundreds or thousands of dollars, was necessary to demodulate and decode this transmissions. Today, you can use the processing power of your Macintosh to decode and display these modes, without any hardware. Just connect your radio's speaker output to your Mac's microphone input, and you're ready to go.

MultiMode supports the following modes:

Morse Code (CW)
RTTY (Baudot)
ASCII
SITOR-A
SITOR-B / FEC / NAVTEX
SSTV (Slow Scan TV)
WEATHER / SATELLITE FAX
ACARS (Aircraft Communications)
PSK31
ALE (Automatic Link Establishment)
DTMF, CCIR, EIA Tone Modes
Hellschreiber
Audio Spectrum Display / FFT Mode

Black Cat Systems creates and distributes Macintosh software, with a specific emphasis on programs for the scientific, amateur radio, and health markets.

Information about Black Cat Systems entire line of products can be found at http://www.blackcatsystems.com

Can you please clarify what you mean by a vertical accuracy of 550 feet.

Do you mean that a commercial GPS is typically accurate PLUS or MINUS 550
feet??

Kam 98 vs The PK-232MBX (pre timewave) that I own now.

What does one do that the other doesen't?

What does Timewave's upgrade *REALLY* do?

Is the Kam 98 Worth the 300 and something it costs?

How easy is it to hook a Kam 98 to a Kenwood TS-950SDX?

Is the KamGold Software still around?

Is the PK-Gold Software still around?

I have questions, I need answers

lol

Hi,

If you want to use both the HF modes and VHF packet at the same time you will need a Hostmode program for the KAM like XPWARE for Windows or PacTerm. Both are very good.

But if you just want to run HF modes OR VHF packet (but not at the same time), then there are many FREE terminal programs with split screens etc.

I really like LOGGER. It has a great terminal program that works great with the KAM. It does not support the KAM's Hostmode so you cannot run an HF mode like RTTY and VHF packet at the same time. But if you just want to do one or the other, Logger is great.

Best of all Logger is free. Logger runs under windows and needs a computer with a Pentium 166 Mhz chip at least. (You can run it on a slower computer but it takes for ever to load).

Get Logger at www.itis.net/golist

By the way, Logger is also a great logging program.

Both are Obsolete. Get a PTC-IIe or start using PSK31.
Everything else is crap and uses good bandwidth for no reason.

Take it all to the swap meet and get your money now before it
ends up in the trash with all the Apple IIe and CP/M computers.

Source record: 13114

Hi Chuck,

The KAM98 performs much better than the PK-232MBX.

The PK-232MBX has very poor filters! You can see it for yourself. When copying RTTY, etc the KAM will almost always outperform the PK-232MBX.

The KAM98 also has a much better tuning display. The tuning display on the PK-232 is very small and hard to use. But the PK-232 has a lot more lights to tell you how well an ARQ link is doing, etc. If you like lights, use the PK-232MBX. If you like performance and an easy to use tuning display to tune in signals, use the KAM98.

The KAM98 also has PACTOR and GTOR. GTOR is much better than PACTOR 1. But only KAM's support GTOR. Unless you find another KAM user on the air, you won't be able to use GTOR.

Depending on the firmware in the PK-232MBX, the PK-232MBX also supports PACTOR 1. (But none of the newer advanced modes like GTOR, CLOVER or PACTOR II).

It is just as easy to hook up a KAM98 or a PK-232MBX to a rig. To make life easier, buy 5 PIN DIN plug adapter from radio shack that provides you with FOUR female RCA jacks. The 5 PIN DIN plug will easily fit into the 8 pin DIN socket of the KAM98. Then use RCA cables from the KAM98 to the rig's PTT, AUDIO OUT and AUDIO IN (or mic).

If I had to choose, I would choose a KAM98 over a PK-232MBX any day!

It is my understanding that the Timewave DSP upgrade simply puts a DSP audio filter in front of the existing poor analogue filters inside the PK-232MBX. The Timewave upgrade also replaces some IC chips with some chips that draw less power. So the overall power consumption will be less.

With the DSP filter upgrade, the PK-232DSP should perform as well if not better than the KAM98. But you are still stuck with the poor tuning display of the PK-232.

You can also buy an external DSP audio filter from Timewave called the DSP-599zx. It supports SSB, CW, RTTY, PACTOR, AMTOR, GTOR etc. You can put this audio filter in front of the KAM98 or the PK-232MBX (or any TNC). It will improve the performance of the KAM98 or PK-232MBX and you also get an excellent DSP audio filter for SSB and CW.

I have never heard of KAMGOLD. But there are lots of great DOS and Windows based programs for both the KAM and PK232. XPWARE for windows supports both the KAM and PK-232. It is very good.

But if you can afford it, forget about the PK-232MBX or KAM98 and buy a SCS PTC IIe (for $650 US). It is by far the best modem around. It not only supports RTTY, AMTOR, CW and PACTOR 1 but also PACTOR II, PSK31 and SSTV. PACTOR II is amazing. It is much better than GTOR or PACTOR 1. Data just screams along the screen. You won't regret buying a PTC II.

You will find most MBO's on the air today using the SCS PTC IIe or SCS PTC II.

If you can't afford a PTC II, buy a second hand SCS PTC 1. The PTC I supports RTTY and PACTOR 1. It is a great PACTOR 1 modem with TRUE hardware memory ARQ. But finding a second hand SCS PTC I is a challenge in North America.

Source record: 13115

Actually the biggest part of the error comes from the SA injected by the
military.

Vertical position on a GPS is pretty worthless.

Oh, and I believe that most GPS receivers take the warped shape of the earth
into consideration when determining vertical position. There are some
mathematical models for doing so.

Think of it this way, if you are the military trying to protect military and
civilian assets, you don't want the enemy to be able to precisely target it
as we do theirs. Horizontal accuracy can have a major effect on a missile's
detonation point, but vertical accuracy can be much more significant. If a
missile is on a 10:1 glide path, a 550 ft elevation differential can mean
missing the target by a mile!

And when looking at a lot of uses of GPS, horizontal accuracy is much more
important than vertical accuracy. Who cares how high the street is, you just
want to know what street you are on.

From: Paul Breed <Paul@Rasdoc.com>
Message-ID: <390040EE.E516F92C@Rasdoc.com>
Source record: 13116

I've build a 1200 baud TNC using the MX614, and small HT for a
telemetery
system for RC aircraft.
Now I want to build a smaller unit, and I was thinking that I would do
9600 baud on 70cm using something like
a MC13176 and direct FM modulation. Where can I find specifications for
the "radio" part of a 9600 baud link?

I have references for AX.25 (And have written code that succesfully uses
this)
What I don't have is a specification of the radio signals.

Specific questions:
1)I assume that 9600 baud packet is NRZ, is there any scrambler for
better 1/0 ballance,
or does the bit stuffing suffice?

2)What is the nominal deviation?

3)Any Ideas on a cheap scanner that can be modified for 9600 baud RX?

Paul (Kl7JG)

Yes there is scrambling -- I don't know the polynomial used though.
Search the web; the original designer was James Miller G3RUH.

And it isn't NRZ, it is NRZI.

Actually it was Steve Goode, K9NG. The details are in an old ARRL CNC
document. James came up with an improved design which was compatible.

1740. MultiMode 3.3.0 Released

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-22 00:00:00 UTC
From: csmolinski@erols.com
Message-ID: <csmolinski-ya02408000R2204002248500001@news.erols.com>
Source record: 13126
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.shortwave,rec.radio.scanner

I've released version 3.3.0 of MultiMode, the digital modes decoding (and transmitting) software package for the Macintosh.

The latest version adds 300 and 1200 baud packet radio (recieve only). There have been lots of requests for packet support in MultiMode, so here it is!

MultiMode is shareware, a copy may be downloaded from the following URL:
http://www.blackcatsystems.com/software/multimode.html

1741. Here is HTX-10 mike pinout

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-23 00:00:00 UTC
From: cvfrayedknot@cs.com
Message-ID: <20000423013403.16032.00002945@ng-ck1.news.cs.com>
Source record: 13127

OK, so I didn't have any test equipment at home, but I did have a set of eyeballs
and a soldering iron. I took the mike apart, drew the schematic and trace the signals to the DIN connector. Here it is:

Looking at the end of the mike cable din connector, the pins are labeled 1 to 6 starting with 1 on the upper right and counting clockwise around with pin 6 being the center.

5 1
4 6
3 2

1 is WHITE and is the microphone output
2 is RED and is the SPEAKER GROUND for the audio system which is why the speaker will not work unless the mike is plugged in!
3 is BLUE and is the PTT key and a ground here will cause rig to transmit
4 is BLACK and is the UP/DOWN function, down is ground and up is +v
5 is SHIELD and is ground
6 is BROWN and is the +MIKE supply

There is enough room inside the mike case to install a 1/8" stereo socket so that
you can bring audio in and key in for PSK control. You can take audio out from the socket on the back of the rig. You can also put a socket in the rig case to do
the same thing and solder the wires to the mike DIN male socket on the back but remember that the numbers will be reversed there.

While this rig has not IF shift or filters installed it works very good on PSK31. I
have been playing with it in the receive only mode for 2 days now and have been very pleased with its capabilities.

Have fun.

Actually it depends on the version of the PK-232 you have. A non-MBX to PK232/DSP is $159. A PK-232MBX without a daughter board is $129 If you have a PK-232MBX that has been upgraded with a daughter baord the kit is $142.

I am considering purchasing a TM-D700A for base use. Primary uses will be voice as well as conventional packet. I also eventually plan on experimenting with APRS.

I have read the latest review in QST on the radio, and the reviewer seemed very pleased with it. So, I am asking for additional comments as well.

Thanks in advance!

Hello,
I have been tidying / clearing the shack and have the following forsale

Standard C500 + 2 Nicad cell (require deep cycle charging) +
Mobile holder + 6 AA Nicads and case (no box but with workshop
manual - No mods to radio) £50 + P&P

VUR30 dual band linear power amplifier by Microset for 144 & 432 Mhz
1-5w input 30w output with 16bd gain RX preamp. Ideal for use with
dual band hand set in mobile set up (one coaxial lead when used
with dual band aerial) or FT290 / FT790 £80 + P&P

Both C500 + VUR30 Amp £120 + P&P

Kantronics D4-10 UHF Data radio 2 channel (432.550 & 432.625 Mhz)
10W Tx power 19K2, 9k6 and 1k2 baud ready (plug in and play) with
manual and leads for KPC9612 £250 o.v.n.o. + P&P

Kantronics KPC9612 2 port 9k6 / 1k2 TNC (Ver 5 firmware). Sorry no
printed manual - disk with gif images supplied. £150 o.n.o. + P&P

Both D4-10 UHF Data radio and Kantronics KPC9612 sold
together £370 o.v.n.o. + P&P

TEKK KS900 UHF Data radio 2W tx power single Xtal channel
(432.625 Mhz) 9k6 1k2 baud ready (plug in and play) with manual
and leads for TNC2H £120 o.n.o. + P&P

TNC2H - DK9SJ 9k6 baud TNC (on board G3RUH modem not an add on)
by Symek with manuals *can be modified for 19K2 baud* £120 o.n.o. + P&P

Both TEKK KS900 and TNC2H sold together £200 + P&P

Wood & Douglas PK144D 2 metre Data radio 9k6 /1k2 baud ready.
**synthesised 4 channels can be modified to use 2 x BCD thumb wheel
switches to give 80 25Khz channels on 2M. ** With manual and W&D
mod sheets. £50 + P&P

Pac Comm PC320 2 port TNC (TNC220 on a PC ISA card) has HF
(300 baud) and VHF (1k2 baud) modems plugs in to standard 8bit ISA
PC slot (card is 3/4 length will fit into most cases) with manual and
lead to connect to C500 £50 ono + P&P

Serial card gives 2 high speed RS232 ports (uses 16550 UART chip,
can be configured for com 1 to 4 on IRQ 2,3,4,5,10,11,12 or 13 by jumper

settings) made by Lava Computers in Canada. £5 + P&P

D-Link DE-200 Ethernet card (no manual but disk with drivers) £5 + P&P

2 off backer cards PC backup on to Video tape driver disk some info offers

Pye A200 60W linear modified for 2m use (not been used for some time
and requires attention - drops out when drive power applied) £15 + P&P

MET 5El 70cm Yagi and 10M + of UR67 / RG8 coaxial cable £10 + P&P

Pye Aerial filter 132 - 174 Mhz Type AT29988/AB £5 + P&P

Pye Aerial filter 68 - 88 Mhz Type AT29988/E £5 + P&P

Pye W15FM Westminster on 4M - channels 70.26, 70.45, (? 70.325) with
carry pack (needs new Nicads) & Charger. £18 + P&P

Telecomms Folded dipole antenna for 68 - 88 Mhz in new condition £8

Pye Westminster 5Amp PSU £8 + P&P

Pye W15FM Westminster on 4M - channels 70.26, 70.45, (? 70.325)
[selling for M0AFF] £15 + P&P

Commercial end fed Half wave vertical for 4M [selling for M0AFF] £10 + P&P

HT transformer 3760 - 0 - 3760 @ 380ma primary tapped for 110 220 234 240
(heavy 74Lbs so you are going to have to collect this one !!!) £40
Or I will swap for 0 - 1600 (800 - 0 - 800) @ 1Amp HT

If you are interested e-mail me I am located in Manchester
&73 Martin.

1753. Problem with SB16 sound card in DOS mode with FTV.

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-24 00:00:00 UTC
From: Andy Straw <andy@nospam-straw1.freeserve.co.uk>
Message-ID: <8e29lpmjc1@news8.svr.pol.co.uk>
Source record: 13139

Note - if you e-mail me remove the 'nospam-' after the @ sign.

Can anyone help? I have sucessfully used FTV (fax and sstv software) on a laptop with built in soundcard but when I try it on a desktop machine with a Creative Labs SB16 PCI soundblaster card I have no luck.

If I access this soundcard from Windows with the PSK31 facility in 'Logger' then it works fine but when I go into FTV (which operates in DOS) the program registers no signal (although when it starts it correctly identifies the soundcard IRQ, DMA and address).

I have tried the only fix on the creative site which is to disable LPT interupt sharing.

Any ideas welcome - please e-mail a copy direct but remove the 'nospam-' after the @.

thanks,

Andy

1754. Digipan "Snap" function

I've heard Windows 2000, based on NT, does not allow direct access
to I/O ports. Many DOS programs rely on direct access to I/O ports.
Perhaps that is the problem.

1756. ANNOUNCEMENT: Dayton Hamvention PACK*BASH!

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-24 00:00:00 UTC
From: srbible@gate.net
Message-ID: <3904de13.12705229@news.gate.net>
Source record: 13142

Dayton Activities

Attending the 2000 Dayton Hamvention? Then don't miss out on
PACK*BASH!

What?
An event for the digitally-inclined ham, featuring:
* Buffet dinner
* Keynote Address: "Amateur Radio and Submarine NR-1"
by CDR Chas Richard, W4HFZ, USN

Commander Richard will give an overview and description of
Submarine NR-1, the U.S. Navy's only nuclear powered, deep
submergence submarine. He'll talk about highlights of some
recent missions, including the 1997 "Isis" operations in the
Mediterranean with Dr. Robert Ballard, with details of the
discovery of the oldest known shipwrecks in the deep ocean.
He'll also talk about Amateur Radio Operations on NR-1 and her

support ship Carolyn Chouest, and on Amateur Radio's impact
and benefits to both the ship and the crew.

* TAPR special interest group meetings
* "Birds of a Feather" gatherings

When?
Friday evening, May 19, 2000
Doors open at 7:00 pm; dinner served at 7:30 pm
Speaker and meetings after dinner

Where?
NCR "Sugarcamp" Conference Center, 101 W. Schantz Ave. --
South of downtown Dayton, just west of Main St. (Rt 48).
Maps available on the TAPR web site (www.tapr.org) or at the
TAPR booth.

How?
Dinner requires advance registration and payment through TAPR.
Tickets will be available at the TAPR booth on Friday, though
we strongly encourage registration <before> Hamvention.
The cost is $25.00 per person, tax and tip included.

All amateurs are welcome to attend, enjoy the speaker, and
particpate in the meetings, although only those purchasing
a dinner can eat.

To register, contact:
PACK*BASH
c/o TAPR
8987-309 E. Tanque Verde Road #337
Tucson, AZ 85749-9399

Phone: (940) 383-0000
Fax: (940) 566-2544
Internet: tapr@tapr.org

Visa/Mastercard Accepted

Who?
PACK*BASH is co-sponsored by TAPR -- Tucson Amateur Packet Radio, the national leader in digital communication -- and the Miami Valley FM Association, Dayton's packet radio club.

For more information (including maps), go to http://www.tapr.org/tapr/html/dayton.html, or send email to tapr@tapr.org.
You can request information via packet radio at BASH@W8APR.#DAY.OH.USA.NOAM.

It's similar to AFC but with a larger range, perhaps 20-30 Hz or so.
AFC follows the signal once you have it tuned in, but SNAP reaches out
and grabs it in the first place.

Andy,

You post was not clear on how you are trying to run FTV. Here are some suggestions that you may or may not have tried.

Make sure you are running FTV in DOS and not in a DOS window under Windows. Many DOS programs will not work properly under Windows .

Go directly into DOS at boot up and NEVER let windows load. If you are using Windows 95, hold down the F7 key at startup. If you are using Windows 98, hold down the CTRL key at startup. You will see a menu. Select command prompt only to go to the DOS prompt. .

And finally make sure you have the DOS driver for the sound card loaded before you run FTV. (If FTV uses a mouse, you will likely have to load the louse driver in DOS as well)

Let us know whether you have tried the above and more importantly whether it solved your problem.

73's
Rob

Isn't that standard behaviour for a DX-cluster system?
I seem to remember from attempts to forward to DX-cluster systems (the
original thing) in the past that it can only handle private messages, no
bulletins.

Hello Tom,

7.2 is the latest release. It diffffers from the 7.133 release in that it
supports the DSP upgrade. All other functions are identical. The DSP is a
small board mounted on the mother board. Pop the top and see if its there.

Rob:

I'm forwarding today from F6FBB to two different AK1A systems. I don't have the AK1A manual in front of me to look it up-- but I seem to recall there was a parameter the AK1A Sysops had to set to allow bulletin forwarding inbound from 'outside' systems. I was hoping there was something similar on CLX.... but I can't find it.

It would only be better if either of these options actually worked.
I find that if the station I'm talking to is only slightly off freq
on the return, that the program does NOT lock onto the signal, even
tho it is only a few Hz away! I then have to click on the signal
with the mouse to lock on, after missing several characters/words...

Don't get me wrong, I love Digipan. All other PSK31 programs I've
used pale in comparison. Yet, you get what you pay for. However,
I would be willing to shell out some bucks to the author to maintain
Digipan and add features.

In particular, I would like more and easier control over the waterfall
display. How about this for a wish list:
1) the color palette should include a point and click color wheel.
2) there should be a way to save the color palettes in a file, like
Hellschreiber.
3) there should be a zoom to get a larger view of particular trace.
4) there should be a variable speed control on the waterfall.
5) The waterfall display should NOT clear on TX.

Anyone else?

If you're expecting a really aggressive SNAP function, then you
probably will think it's not working. Just try operating with both
SNAP and AFC turned off for a while and you'll realize they do the
job, provided you're tuned fairly close to begin with. With them both
off, operating becomes difficult and frustrating.

Source record: 13061

Hey Carl,

Got a sound card installed in your PC? Then skip the TNC altogether and use a 'software' TNC. Great way to try the mode before you buy. There are advantages to having a hardware TNC (such as being able to 'stay on the air' after your PC is powered down), but you can sure learn about and try the mode before you plop down your ca$h.

George, SV2AGW, has put together a nice package that provides BBS, terminal, TCP/IP services and more - no TNC required (though if you have one, it can use it as well).

Visit the URL in my sig block - goto the packet page, you'll see the links to the SV2AGW software.

If you're interested in the fastest growing application of packet radio (APRS) you can also look at WinAPRS (http://aprs.rutgers.edu/). WinAPRS functions quite nicely via the SV2AGW Packet Engine.
More APRS info and links to APRS applications for other platforms can be found at: http://www.dididahdahdidit.com/

A large collection of sound card based, ham radio software can be found at:
http://www.muenster.de/~welp/sb.ht
(includes links to Flexnet - another sound card TNC package)

If you're interested in or have access to LINUX, the kernel can be compiled with sound card based TNC support.

Having 29 programs to choose from probably doesn't help him...

I'm mainly into Linux software, but when I occasionally scan tucows or
softseek or whatever for a Windows program with a few simple functional
requirements, I usually get drowned in descriptions of programs that
try to be the be-all end-all of the particular field. But they ofen fail
to perform their basic functionality :-(

Telnet clients are no exception. Before adding all possible bells and
whistles, those guys often can't even get the complete and correct
implementation of the TELNET protocol and an emulation of one single
terminal OK....

I'm curious about AGW's BBS function. Is it a real, full-service BBS, or is it more like a personal "mailbox" that can autoconnect/forward with a real BBS?

I ask because I have never heard of an "AGW" BBS in the BBS network. Lots of FBB, RLI, 4RE. etc, but no AGW.

If you are not opposed to doing a little home-brewing, you
might want to look at this web site:

http://www.ham-radio.com/wa6cgr/

Dave Glawson, WA6CGR, has a real nice article on a microwave
transverter he built. Granted it's for 10 GHz but the approach
would still be the same. He goes from 10 Meters to 2 Meters and
then to 10 GHz. You can skip the 10 to 2 conversion step.

Most of the modules in Dave's system are from M/A-COM

http://www.macom.com

They might have the pieces you need.

And just for grins, take a look at this nice antenna array for 432.

http://www.azurvital.com/lon5of.htm

Good catch Charles,

I've not run any of the SV2AGW software other than the packet engine. There's a description of the "BBS" on George's new web site (yea, the layout is still a bit, er, odd) http://www.raag.org/sv2agw/agwbbs.htm

From what I see there - it's more of a message forwarding, reading, sending utility kind of deal. Not a full BBS in it's own right. Maybe more along the lines of the PBBS Kantronics plugs into their TNCs?

It looks like a personal mailbox, that autoconnects to the local BBS, and downloads just the stuff you indicate an interest in. Like the ones built into many TNC's these days, but a lot nicer because the computer has more memory to work with, making it possible to have a much more sophisticated mailbox. Looks good.

I dug around the AGW site, and found a section listing second party software that works with AGW. The "AIZBBS" program was listed there. It's a full-service BBS with "FBB" type compressed forwarding. I've never tried out AIZBBS, but I've heard it's an excellent program.

Gents,
What if you have a HK-232 with a mother board and may 93 eproms?
I bought the HK-232 (a AEA PK-232 in kit form from Heathkit)
with the daughter baord. It only had one socket for the EPROM.
My grandfather sent me the May 93 eproms (2). I used 4 wire wrap
sockets (@ for the eproms, 2 for the addressing chips) and made
myself an adapter for 2 eproms. Is the DSP required to work
Pactor, or is having the EPROMS all I need?

I have used LOG-EQF for many years. It is shareware and registration is
cheap. Although there are others with more bells and whistles EQF is a
good Logger that will do just about everything you will need.
Log / Contesting / Packet / DX Cluster / Rig control / Rotator control
/ Award tracking / label printing etc.

Dick,

There are lots of great FREEWARE logging programs for Windows available.
Here is a brief list:

1. LUXLOG by LX1NO (32 bit) -- see http://www.qsl.net/lx1no/llog_win.html

2. WINLOG32 by G0CUZ (32 bit) -- see http://www.winlog.co.uk/

3. SuperWinLog (16 bit) by G0CUZ - see http://www.winlog.co.uk/

4. Logger by Bob Furzer (32 bit?) -- see www.itis.net/golist

They are very good. If you want to also try PSK31 with your computer's
sound card, then try Logger. Logger also has a PSK31 program for a sound
card built in. Logger is very popular.

1800. Re: Pactor with PK232MBX

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-28 00:00:00 UTC
From: Rob <Pse@NoEmail.Com>
Message-ID: <__oO4.33275$Xk2.122838@tor-nn1.netcom.ca>
Source record: 13086

Hi

With the PK232, it is my understanding that you only need the latest EPROMS (ver 7 ??) to work PACTOR. You do NOT need DSP for PACTOR.

I would expect that the EPROMS would also work in the HK-232 but I am not sure. Ask Timewave for compatibility and pricing.

But the PK-232 has really poor filters. If you want to improve its performance on RTTY, AMTOR, PACTOR etc, you really need to put a good audio filter in front of the PK-232.

You can use EITHER a good DSP filter or a good analogue filter. (Under certain band conditions, an analogue filter may outperform the DSP audio filter). DSP is not always the best!

There are two ways to add DSP filters to the PK-232. You can buy the DSP filter board from Timewave. It mounts inside the PK-232. It may mount inside the HK-232. I am not sure. It is best to ask Timewave. Or you can use an EXTERNAL DSP filter.

I do NOT believe that the Timewave DSP upgrade to the PK-232 adds TRUE hardware memory ARQ using the DSP. The DSP upgrade is simply a DSP audio filter optimised for RTTY, AMTOR and PACTOR. When you switch modes, the PK-232 automatically selects the right DSP audio filter.

Consequently, even with the DSP upgrade, the PK-232 will NOT perform as well as TRUE DSP multimode controllers on AMTOR and PACTOR which use the DSP NOT ONLY for better filtering BUT ALSO for hardware memory ARQ. (If I am wrong, someone please correct me).

In other words, with the DSP upgrade, it is my understanding that the PK-232 is a "PSEUDO" DSP multimode controller. Not a TRUE DSP multimode controller.

Alternatively, you can also buy an EXTERNAL DSP filter that supports RTTY, PACTOR etc and place the filter in front of the PK-232 (or HK-232). The external DSP filter should work as well as the internal DSP upgrade for the PK-232 (if the external DSP filter supports RTTY, AMTOR and PACTOR!).

Timewave sells a great external DSP filter -- the DSP-599zx that you can use NOT ONLY on RTTY, PACTOR, AMTOR, etc BUT ALSO on SSB and CW. But when you switch modes on the PK-232 or HK-232, you will have to remember to switch the filter modes on the external DSP filter. But if you also work a lot of CW and SSB, the external filter route may be the way to go.

There are other manufacturers who make DSP filters for RTTY and PACTOR etc. The DSP-599zx is a great filter but it is expensive.

Alternatively, buy or build a good analogue audio filter for RTTY, AMTOR, PACTOR etc and place it in front of the POOR filters in the PK-232. But beware, many analogue audio filters are NOT designed for 200 baud PACTOR!

The DSP upgrade kit from Timewave has a replacement daughter board included in the A.06227 kit that has sockets for two eproms. You will need a new daughterboard in order to operate pactor.

If you don't want the DSP upgrade give me a call at (651)222-4858 and I'll see if we can work out a pactor only upgrade since you have the very early HK upgrade. They are pretty rare.

An interesting observation, Considering the PK-232 design I think you might be
hard pressed to find a better analog filter. What have you used?

>
>You can use EITHER a good DSP filter or a good analogue filter. (Under

Your are correct, The upgrade is a DSP filter in line before the analog
filters of the PK-232. We thought the value of inproved DSP filtering
in a $125-$150 upgrade as opposed to the $600 to $800 dollar complete DSP box
was a better service for existing PK-232 owners. However the is nothing
":pseudo" about the DSP filters. They reduce bit error rates considerably
better than other filter designs. We have been designing DSP filters long
before they became a ham staple for the military. In fact Timewave introduced
DSP to the ham world.

What other ham product are you aware of the can be upgraded from the initial
10+ year old design to the current state-of-the-art?

>
>Alternatively, you can also buy an EXTERNAL DSP filter that supports RTTY,

>

True, I advise owners who call Timewave about upgrading that if they have a DSP-599zx or DSP-59+ or the DSP-59Y that they do not need the internal DSP upgrade. I'm sure some who has called with that question can confirm this if your a bit skeptical of us "turning down business".

If you are at Dayton come by our booth at 111 and talk filters. There will be some interesting stuff there.

1805. CW decoding software

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-29 00:00:00 UTC
From: Paul Freeman <pfreeman@otw.com>
Message-ID: <390a8f0c.0@news.otw.com>
Source record: 13091

Good morning all,

I've downloaded FTV version 1.1a but cannot decode CW input signals. I've tried all methods of input via mike and line inputs but with no luck. Software will not recognize CW tone. I'm running Windows '98 with an "Integrated SoundBlaster AudioPCI 64D" card. (within a Gateway running a 350 mhz.) Any chance I should use DOS with this? I know nothing about DOS!!

I've tried the program "CW GET" decode software and it does decode CW quite well under the same computer configurations.

I've tried "POLAR ELECTRIC ENGINEERING MRP 373, but have the same problems as with FTV -- no tone recognition.

Any thoughts as to my problem? I must admit I'm not a pro with PC's -- I'm a MAC man and have used Black Cat decode software fine.

Last program that looks real nice is RadioCom 4.0. Demo looks very good. Is anyone using this program in a CW transceiver mode? And what are your comments?

Thanks,
Paul

Source record: 13094

Hi John,

I frequently run two or more RTTY TNC's at the same time on receive all in different windows. It is a great way to compare modems (and RTTY/PSK31 sound card programs). Alternatively, one can record transmissions off the air and save them into a .WAV file. (DO NOT USE a file format that uses compression you may lose information). Then replay the audio signal back through each modem and see which modem performs the best. Hams have used this approach to compare SSTV modems - see http://private.addcom.de/a-ethiem/hf4vglen.htm

I do not know why the ARRL does not use this technique to compare the performance of the various digital modems. At least they can provide results that are much more OBJECTIVE than the article they published in April, 2000 QST (which I found very subjective)

In my view, the KAM has slightly better filtering than the PK-232 (or HAL PCI-3000). (But I will admit that the difference is not that great). If I had to choose between a KAM and a PK-232, I would choose the KAM. The KAM's switched capacitance filter design is very effective and is much more flexible than the PK-232 fixed 8 pole Cheby design. With the KAM you can set the mark and space frequency independently (and hence the SHIFT) via the software. With the PK-232 you are stuck with 200 Hz shift. To me, it is not surprising that when copying 170 Hz shift RTTY and AMTOR, the KAM performs slightly better than the PK-232.

On a different point, I find that the tuning display is also much better in the KAM than the PK-232. But the PK-232 has a lot more status lights! If I had to choose between a KAM and a PK-232, I would personally choose the KAM or KAM PLUS. I am sure that there are others who would choose the PK-232 over the KAM.

Many of the commercial digital modems clearly outperform the PK-232 (and the KAM). For example, the HAL ST-8000 is probably the BEST modem on the market that uses analog filters (but it is a little pricey!).

But most people cannot afford a ST-8000! The DSP modems are a lot less expensive and generally perform better than the old digital modems that use analog filters. DSP has really made it possible to offer great performing modems to the amateur radio community at a price that most Hams can afford.

But I have found some exceptions. During severe multipath propagation, I find that the TNC's with analog filters (e.g. KAM, PCI-3000 , etc) tend to outperform the TNC's using DSP (such as the SCS PTC II, DXP-38, and your DSP-599zx).

Consequently, I like having two TNCS running at the same time for receive (even on the Burst modes) -- an TNC using analog filters and a TNC using DSP. Sometimes the copy is better on the TNC using the analog filter under certain conditions. (But I only use one TNC for transmit - Hi).

I would also like to make one final point. I have been told by Hams who have experimented with TRUE hardware memory ARQ that True hardware memory ARQ (as found in the SCS PTC II, HAL DXP-38 etc) only increases the performance of the modem slightly (5 to 10 percent). In my view, the lack of true hardware memory ARQ in the PK-232 or PK-900 (even with the DSP upgrade from Timewave) or the KAM is not a big deal. Much more important is how the TNC actually implements the various modes in the firmware. In particular, some modems CLEARLY do a much better job at implementing PACTOR 1 protocol than others (even if all the modems being compared use analog filters). Some modems do a much better job at implementing the phase correction routines etc in PACTOR 1.

I am very happy to hear that you advise your customers NOT to bother with the DSP upgrade if they already have the DSP-599zx filter. I wish more manufacturers and dealers gave more candid advice. I really like your DSP-599zx. It is a great audio DSP filter and RTTY DSP modem. Clearly, Timewave thought about the needs of the digital operator when designing the filter. The internal RTTY modem is a great touch.

I realise when the DSP-599zx was released, PSK31 was not around. I hope Timewave considers adding a PSK31 mode to the great list of digital modes supported by the DXP-599zx. (I realise you can use the SSB filter but a dedicated PSK31 filter would be better!)

You should be able to find a kpc-3 pretty cheap (50 - 60 bucks) and
get an old 2 meter radio (GE, Motorola, etc) for about half that, but
then you have to buy crystals. Check into the MFJ data radio, might
be the price to use for shopping for cheaper. Then just build a
copper-pipe J pole, and your all fixed up...

However, since neither modem can handle Pactor 2, most users of the Kam or PK-232 would probably be better off using the FSK feature of their rig rather than having the modem key the rig in AFSK, and most rigs with this feature allow either 200 or 170 Hz shift.

I own both a PK-232 (late model eproms), Kam Plus (the latest) and an SCS PTC-II. Frankly, I found the Kam to be far and away the worst of the three for Pactor and everything else. It did not seem to handle Pactor-1 nearly as well as the PK-232, and compared to the SCS PTC-II the difference was simply too great to ignore. It is simply hard to keep a Pactor link going on a Kam because it does not seem to implement the mode very well. I was bitterly disappointed in my Kam Plus. It now languishes in my junk box.

The Kam is also buggy. I and others have noted its tendency to slip into Packet mode for no reason in the middle of a Pactor QSO. GTOR is unspeakably buggy, it only functions well when conditions are pristine. GTOR drops link for no reason on a frequent basis even when conditions are excellent. GTOR is nothing like Pactor 2 which is a true weak signal mode.

I have no idea what the above means. There is nothing preventing one
from using the IF filters in the rig, which is better than any audio
filters that are behind the AGC function. I have never found that the
Kam could perform as well as the PTC-II.

I cannot agree with the above. 5 or 10% is a LOT, especially under
marginal conditions on a DX link that you are trying to keep going!!
You can tell when memory ARQ has reconstructed a packet, and often it
is the difference between keeping a link and losing it. (Usually in a
link that a Kam would not have been able to maintain in the first
place).

Meaning no disrespect, but per my above comments, the Kam is the worst
of the three.

Hello!!
I have a web page dedicated to the radio hobby here in Tampa Bay Florida. I am in the process of launching a new audio chat network on a channel for amateur radio enthusiasts. The idea is for webmasters to put the small html code somwhere on their amateur radio web page which would be linked all together worldwide. The system utilizes the new HearMe plugin which is a small 80k or so program new visitors of the amateur radio audio chat would download upon landing on the page which has the html code for the plugin. Please let me know if you decide to use the system so I can add your site to my links page to let others know your site is connected to the network. For a demonstration of the system you may email me for a time and date so you can see it in action. To get the html code please visit my web site below. To get further info on the HearMe requirments to have it work click on the help are for Hear Me on my web site. I am in no way affiliated with HearMe and my web site is a noncomercial page.You may also visit my radio page at the url below from 7pm to 8pm eastern time every day I try to be in my scanner audio chat at that time. I look forward to hearing from.
Thankyou
Best Regards
Tim Breckon--

Ken,

To my knowledge, Logger does not have an "OFFICIAL" web site.

Logger first appeared on the GOLIST web site. Then other web sites, like
the at chroniclenetworks, started to appear.

It is a good idea to check both web sites for the latest version (ver
7.04??)

Hi,

Thanks for your comments.

I agree with you that it would appear that KANTRONICS has done a REALLY poor job at implementing PACTOR 1. In my view, KANTRONICS could have done a much better job.

(But on RTTY and AMTOR, the KAM appears to perform slightly better than the PK-232/900 (without DSP)).

I agree with you that the PK232/900 (without DSP) appear to perform better than the KAM on Pactor 1. But neither the KAM or the PK-232 have hardware memory ARQ. I suspect that either the protocol implementation is better in the PK-232 or that the hardware (e.g. filters etc.) are better in the PK-232 at least for the Pactor 1 mode.

But I have NEVER had the KAM slip into Packet during a Pactor QSO. (And I have used the KAM a lot on Pactor). Perhaps, you have some RFI problems or a hardware problem in the KAM.

I also have not had any problems with GTOR. But I must admit I have not used GTOR much. There just is not that much GTOR activity.

But even some of the DSP modems have not implemented Pactor 1 very well. In my view, HAL did not do a very good job at implementing its P-MODE (or Pactor compatible mode). With the DXP-38, I found that links would suddenly drop even with strong signals. Furthermore, I could never get the DXP-38 to link with real DX stations even using the long path option. (It also didn't make any difference how I set the timing parameters in the DXP-38). But I could easily link with real DX using the SCS PTC II or the KAM using the long path option. In my view, KANTRONICS has done a better job at implementing Pactor 1 than Hal (with its P-mode). I was very disappointed with the performance of the DXP-38 on Pactor 1.

I agree with you that Pactor II is amazing. No Mode comes close in its performance especially with really weak signals. CLOVER appears to need really good strong and stable signals for performance that even starts to compare with Pactor II.

(But even with strong signals, the throughput is typically better in PACTOR II than CLOVER II since Pactor II uses compression and CLOVER II does not. But when transmitting files that do not compress well such as binary files, there is usually not much difference between PACTOR II and CLOVER II with strong stable signals).

But DSP modems are NOT always better than the old analog modems. When it comes to copying RTTY signals under severe multipath conditions (or polar flutter conditions), the KAM sometimes copies the RTTY signal better than the SCS PTC II.

I am not the only one who has made this observation. Under certain conditions, analog modems sometimes outperform DSP modems.

Try it yourself. Connect you KAM or PK-232 to one serial port on your computer (for receive only) and connect your SCS PTC II to your other serial port for (receiving and transmitting). As noted in a previous post, try to use an audio break out box.

1817. DX Cluster equipment advice needed

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-04-30 00:00:00 UTC
From: Floyd Sense <sentek@sprintmail.com>
Message-ID: <5OKO4.8855$x4.282582@newsread1.prod.itd.earthlink.net>
Source record: 13096

At present, I'm accessing a DX spotting cluster via the Internet, and want to change to access a local cluster on 2M. I'm relatively ignorant of the pieces/parts required to accomplish that, and don't want to spend a lot of time searching out info on it. So, what I need are some ideas on an inexpensive approach to getting the job done. I guess I'll need a TNC that can run 1200 bps since that seems to be what the local nodes run, and a 2M FM transceiver.

Keeping in mind that this setup will be used ONLY for the DX cluster (no interest in other Packet operations), what's a good approach to getting the job done?

The best of the best! HAL PCI-4000 digital modem. Sophisticated DSP
processor performs Clover, RTTY, Pactor, Amtor. Works with Express, XPWin,
Writelog, WF1B, XPPCI. Requires 1 full ISA slot but does NOT require an IRQ!
Card is 'A' model, serial number < 600, with latest proms. This is the tnc
that the abbreviated P-38 TNC was designed from. A simular card can be
special ordered from HAL for $995.00
$400 cash or trade forHam equipment of equal value.

TNC, Radio, Antenna

I have used a variety of older and newer TNCs like the PK-88, PK-12,
KPC-3, and others over a period of time. All worked fine. For just
cluster use, older firmware (without GPS/APRS updates) is fine.

I use my HT. I have tried several 2m mobile radios also. All worked.

I use an 2m omni gain vertical. If you are only logging into a single
cluster node you could use a small beam pointed at it, though it may
not be necessary if you a close to it.

Good Luck.

Rob,
I have been following your comments on the various multimode controllers and thought I might add a few comments that may add some information in some cases and only raise more questions in others. The only general comment is that the results of comparisons are highly variable among different individuals and organizations doing the testing!

In article <AWJO4.33506$Xk2.123508@tor-nn1.netcom.ca>, "Rob" <Pse@NoEmail.Com> wrote:
>Hi John,

>April, 2000 QST (which I found very subjective)

Another interesting point in the comparison of RTTY modems (with and without external filters) is how the signals are sent to the filters and modems. The easiest way is to feed a signal to all the modem inputs connected in parallel. I'm quite sure many (but not all - Rob, I suspect you're in the "not all" category) comparisons are done this way. The problem with this method is not all modems necessarily work best with the same signal level in, and not all modems and filters have the an input level adjustment control. Another problem that is possible but not so likely to cause problems is interaction between modems inputs when they are connected together. The solution to both problems is to use distribution ampliers that split and buffer the signal to isolate the modems as well as allow individual level adjustment. Audio distribution amplifiers are routinely used in commercial and professional audio systems.

Once the signals are properly fed to the modems, then the next question is to determine the input signal level for best modem performance. This level may vary for different signal/noise/interference conditions for a given modem and is not necessarily determined by the manufacturer's suggested set-up procedure. (Note: ALWAYS start with the manufacturer's suggested setup procedure!) Trial-and-error with careful observation and note-taking is

likely to be a significant part of figuring out the best input level in a typical amateur radio environment. Good data error rate testers and channel simulators can make this procedure a lot easier and more accurate.
>

To me, it is >not surprising that when copying 170 Hz shift RTTY and AMTOR, the KAM >performs slightly better than the PK-232.
>
This is one of those situations where different testers get different results. In digging through some of the AEA engineering notes from the early 1990s, I found some tests reports that clearly showed some problems with switched capacitor filters compared to analog filters under real-life noisy conditions (they didn't compare them with DSP filters). Unfortunately, I don't remember where those notes are and it would probably take days to find them again, so consider this anecdotal rather that any attempt to defend analog filters!

On the point of different filters, it should be noted that there are more differences than filters among the various modems. The entire architecture, including limiting, agc, DCD, ARQ filters and discriminator design, can substantially influence the data error rates under different conditions. Other than putting an external filter in front of a given modem and observing the performance differences for identical test signals, it is difficult to be sure any performance difference is the result of a particular feature of a given modem (unless the feature can be changed by software). I haven't tried this, but try putting the Kam-Plus in 200 Hz receive and see if it makes a difference in receiving a 170 Hz shift signal from another KAM or a 200 Hz signal from a PK-232. Of course, the results are valid only for KAMs! This brings up the point that performance test results from different modems with similar architectural features can provide enough information to draw conclusions about the efficacy of certain architectural features (e.g., ARQ). Again, the test methods and conditions should be identical to get truly valid information.

>On a different point, I find that the tuning display is also much better in >the KAM than the PK-232. But the PK-232 has a lot more status lights! If I >had to choose between a KAM and a PK-232, I would personally choose the KAM >or KAM PLUS. I am sure that there are others who would choose the PK-232 >over the KAM.

It should be noted that neither the KAM-Plus nor the PK-232 are current versions of Kantronics and Timewave products. The current Kantronics unit is the KAM-98 and the current Timewave unit is the PK-232/DSP. It should also be noted there are about 100,000 PK-232s and a lesser but also large number of KAM-Pluses out there, so one cannot dismiss the importance of information about either unit just because it is not in current production.

The one feature the the PK-232 and PK-900 DSP upgrades both have that the
external filters do not have is the ability to switch filter bandwidth in the
Pactor mode when the data rate switches from 100 to 200 and vice versa in
response to an change in error rate. Of course, if you don't operate Pactor,
this feature is of no value.
>
>I realise when the DSP-599zx was released, PSK31 was not around. I hope
>Timewave considers adding a PSK31 mode to the great list of digital modes
>supported by the DXP-599zx. (I realise you can use the SSB filter but a
>dedicated PSK31 filter would be better!)

Some users have reported to us that PSK31 works better with the appropriate filter from the DSP-599zx in front of the sound card. If the sound card and computer DSP is done well, the the DSP-599zx shouldn't make any difference; however, there may be practical limitations on what can be done with the sound card and computer in light of everything else that has to happen in the PSK31 demodulaton process. We have not made any claims about PSK-31 performance with the DSP-599zx other than to note users' reports. The DSP-599zx does have a computer RS-232 serial interface to radio transmit/receive interface that works with most PSK31 programs. The DSP-599zx also has two audio out channels so it can be used as an distribution amplifiier.

Hi Randy,

Yes, I agree that it not a good idea to feed the audio signal to all the modem inputs connected in parallel. It is much better to use a distribution amplifier. Currently, I am using the DSP-599zx with its two audio outputs as a distribution amplifier. But I am building the "audio break out box" or audio distribution amplifier described in 1998 ARRL Handbook. With the audio break out box you can adjust the audio level for each of the four or five outputs independently. The ideal "on-air" solution for comparing multiple modems on receive.

Alternatively, one can record transmissions received off the air into a .WAV file using your computer's sound card. Then you can replay the .WAV file through each modem (after adjusting the audio output level from the sound card to ensure optimal performance of the modem).

I also agree with you that the performance of a modem is not dictated solely by the filter used. The architecture of ALL the hardware (e.g. the limiter etc) are also very important. Furthermore, especially when dealing with the BURST modes like AMTOR and PACTOR, the implementation of the protocol can be a big factor. (see my next post).

Many thanks for the information on the difference between the internal DSP upgrade to the PK-232/900 and the external DSP solution using the DSP-599zx. My DSP-599zx has a Pactor filter mode. Since the DSP-599zx has no way of knowing the error rate and can not switch between a filter optimised for 100 baud and a filter optimised for 200 baud based on the error rate, I suspect that the DSP-599zx just uses a filter optimised for 200 baud in Pactor. Is this correct?

I agree that in most cases the DSP-599zx should not make much difference on PSK31 since the sound card uses DSP anyway! In any event, you may want to consider adding a PSK31 mode to the DSP-599zx where you can really shift the centre frequency high enough. (If my memory serves me right, you cannot use the DSP-599zx using its CW mode on PSK31 if you use 2200 Hz centre frequency for PSK31. I don't think you can shift the frequency high enough. You must use the SSB filter which is a little more awkward).

This is ridiculous. Where's the whining? Where's the expressions of how this country is going to hell? Where's the complaining about CB, and the Liberty Net references? You have cluttered this page with relevant observations, and you seem to be enjoying yourself on psk31. You, "sir," do not have the proper attitude.

WHO ARE YOU?!?! ($1)

War PSK31!

Hello,

I am wondering if anybody would have schematics for a relatively
'easy-to-build.' 144MHz to 28MHz transverter.

Coverage isnt that important. At least 3MHz would be great.

Yup! What they said!!! Any 2 M radio / TNC will work. Look at hamfests,
which are popular this time of year. You should be able to find an
older synthesized rig for $100 or so. This way you are not 'stuck' with
one frequency. I use a copper J off the side of my tower.... G'luck

I admit that I almost never use RTTY, and Amtor is pretty much gone.
I will say that the PK-232 was very very good on Amtor IMHO.

>

the PK-232
> at least for the Pactor 1 mode.

You are absolutely right that the PK-232 lacks memory-arq. The reason
that the Kam does such a miserable job on Pactor is apparently caused
by a number of factors. I do not think it is the filtering -- I used
my Kam + with good tight cascaded IF filters (500Hz) and it still
performed very very poorly.

>
> But I have NEVER had the KAM slip into Packet during a Pactor QSO.
(And I
> have used the KAM a lot on Pactor). Perhaps, you have some RFI
problems or

No, I don't think so. It is a bug in the Kam. Others have noticed it too. Especially prone to happen on GTOR.

>
> But even some of the DSP modems have not implemented Pactor 1 very well. In

I have heard this. So where we are is that the only good Pactor TNCs are the SCS PTC series and to a lesser (but lower-cost) extent the PK-232. The Kam appears to function best as a packet and RTTY box. (I will say that my PTC-II controller does a stellar job on my relatively infrequent RTTY contacts). This was essentially the point of my earlier post.

The .wav technique is the proper approach, running multiple TNC's in
parallel allows you to "select" the best one by the level setting you choose.
For example if Box A likes 135mv and box B like 400mv One or the other will be
over/under driven by the signal setting.

>
>I do not know why the ARRL does not use this technique to compare the

They also us3d the parallel approach and did not release the sif\gnificance of
the approach until it was published.

>

In an engineering sense, SCAF filters are lots cheaper to build that an
eight-pole Chebyshev filter. I expect that is why it was designed into the
KAM.

To see a really good SCAF implementation seee the FT-990 filters.

You might want to checkout "http://www.hamtronics.com".
Hamtronics has linear transmitting converter and receiving
converter kits. It would be a lot easier to use the kits as
modules and eliminate hunting up all the parts.

Hamtronics prices are reasonable and are fairly easy to
assemble. I have one of their XV-2 transmitting converters.

Source record: 13018

Hi,

Just some final comments on the KAM on Pactor.

In my view, many of the DEFAULT settings in the KAM adversely affect the performance of the KAM on PACTOR (and AMTOR).

You sound like a very knowledgeable KAM user. I am sure you have changed many, if not all, of the parameters discussed below. But in case other KAM users may be following this thread, here are some important tips for improving the KAM's performance on AMTOR and PACTOR.

KANTRONICS insists on the TXDTor Delay setting be 5 (for 50 ms). This setting is TOO high in my opinion. Most rigs switch between 20 and 30 ms.

A setting of TXDTOR 3 (30 ms) is a much better choice for most rigs. A long haul DX QSO's on either AMTOR or PACTOR, you may have to change TXDTor to 0, 1 or 2.

If you want to save the relay in your rig, you can use the PREkey and POSTkey command. I like using:

PREKEY 6
POSTKEY 6
TXDTOR 2

(With these settings, the total TX Delay is 30 ms)

And finally, most AMTOR and PACTOR (and even RTTY) these days uses 200 Hz shift. I find that the KAM performs much better on AMTOR and Pactor when 200 hz shift is used. You must change the following settings:

Mark 2110
Space 2310
Shift Modem

P.S. You may have to change the Space setting first since I do not think the KAM lets you set a MARK frequency higher than the SPACE frequency.

OTHER OPTIONS:

Yes the PK-232/900 appears to implement the Pactor 1 protocol better than the KAM and HAL DXP-38. The SCS PTC1 and PTC II do an outstanding job at implementing the Pactor protocol. (this is not surprising since SCS invented Pactor).

But there are other options. I hear that BMK-MULTY does a great job at implementing PACTOR 1. BMK-MULTY is not expensive and is a FULLY licenced version of PACTOR. But you need a standard digital modem that decodes the

mark/space signals and sends them to the computer via the RS-232 port. The older analog modems work well such as the CP-1, HAL ST-8000 etc.

The internal modem in the DSP-599zx might even work (but the internal modem in the DSP-599zx is design for RTTY baud rates NOT for 100 or 200 baud rates).

Mike,

It is my understanding that the Pacomm Pactor controller is an EXACT clone
of the SCS PTC I Pactor controller.

I had one for awhile but returned it to the dealer since it would NOT work
due to RFI problems. (The early serial numbers of the Pacomm Pactor
controller had RFI problems. Apparently, Pacomm later fixed the RFI
problems with bypass capacitors etc).

If you want a better manual, information on commands etc, you may want to
contact SCS at www.scs-ptc.com if Pacomm won't help you.

I do not know whether Airmail will support the SCS PTC 1. If it does, it
should support the Pacomm Pactor controller.

The Pacomm Pactor controller is a GREAT pactor controller for Pactor 1 with
TRUE hardware memory ARQ. The KAM, PK-232/900 (even with the DSP upgrade)
do NOT have hardware memory ARQ. In my view, the PTC 1 or the Pacomm
Pactor controller CLONE is a much better TNC than the KAM, PK-232 etc.

But if you really want to experience fast data transfers, you must use
PACTOR II. But the SCS PTC II and PTC IIe are pricey.

Yep - just tried that and it worked. However, have not been able to figure
out how to delete a contact in the log. Anyone know?

Source record: 13024

Hi all;
In February of 1999, at the Orlando HamCation, I bought, from Dentronics, a BRAND NEW PacComm PacTOR Controller for $265.00

It works fine!

However, I could never get support for the unit from PacComm for a 'proper' manual. The PCB bears only a slight resemblance to the Documentation, and the Command vocabulary misses the manual in many areas. There are unknown commands that I found - meaning hazy - and commands supposed to be there - weren't. PacComm said that's the manual that comes with that unit!

No never mind, as I have been using the system for a year and enjoying it - especially being able to send E-mail from my RV and from my Boat, and when travelling!

NOW, some of the Win-Link stations will REQUIRE Airmail to talk to me!

No more 'keyboard' contacts available.

GOOD! EXCEPT my 'old' PacComm PacTOR Controller isn't supported!

This unit is an 'Orphan'! No 'Airmail' for me!

Mine's the loss!

Don't whine, don't cry! Just tuck your tail up tight and run away - again!

Someday, Someday, I'll buy something that is ahead of it's time enough that people will beg to buy 'mine'! Yah, Right!

This certainly is a practical way to compare modem performance. It's probably asking a little too much to hope that a suite of .WAV files that cover the most common operating environments (QRM, static, weak signal, polar flutter, etc.) could be agreed upon as a standard and freely circulated among all interested parties. We would end up with better modems, but I'm afraid some of those who might not like the results of tests using the standard suite would object and develop their own "standards", thus defeating the whole purpose of the exercise!.

>this correct?
>
Yes, the Pactor filter in the DSP-599zx is a 200 baud filter, because a filter optimised for 100 baud would not work very well for 200 baud. (an aside for all the U.S.A. spelling experts - yes, I could spell "optimise" as "optimize", but Rob used it first so I defaulted to "optimise" for this conversation!)

I've used Polar's MRP373 for a couple years, and it's a great program.
Unfortunately, it will not work with modern PCI-based sound cards, nor
those based on the new Yamaha chipsets. I have a Soundblaster PCI512,
and MRP373 won't work with it. A new version is supposed to be released
(in June I think) with re-written code for the new cards.

Hi All,

For those of you who use APRS, or any other Amateur Radio
activities where GPS is used/needed, you will be happy to know that
Selective Availability (SA) has been turned OFF, at 0000UTC on May 2,
though the full effects weren't noticed until around 0500 UTC.

So, look forward to greater accuracy with your GPS receivers,
with less wandering, and improved altitude readings! Make no mistake
that there will still be errors caused mainly by the atmosphere.

Also, for those now wondering what will come of DGPS now that
SA is off, please remember that DGPS is the most accurate "form" (for
lack of better words) of GPS (1-5 meters) -- even better than GPSs
WITHOUT SA (unless long averaging is used, similar to the ones used
for surveying). So they'll still be used heavily for many
applications!

Enjoy!

73,
Brian, N5ZGT

The PacComm PTC-I controllers are exactly the same as the SCS PTC-I controllers. I had one and I was even able to replace the ROM with an upgraded SCS ROM with no problem. If AirMail supports the SCS PTC-I, it should run with the PacComm unit. The PacComm PTC-II is a whole other story. PacComm redid the front panel board and they do have problems in some modes. The last I heard, PacComm was no longer supporting those units.

Hi Bob,

It is my understanding that Pacomm was granted a licence by SCS to manufacture a clone of the SCS PTC I. But it would appear that Pacomm did a poor job at manufacturing a clone. I suspect that they cut corners at least with the earlier serial numbered units and RFI problems were the result.

I wouldn't be surprised that the relationship between SCS and Pacomm became strained. Perhaps, Pacomm no longer has a licence to make their Pactor controllers!?

http://www.zdnet.com/zdnn/ ZDNet: News: Page One has an article "Will e-business become just business?" in which Richard Shim points to wireless computing and genetic engineering as driving a new global economy over the next five to ten years from 2000.

There is a Talkback section where you may contribute ideas, e.g.:

The AI based cybernetic economy will change things more drastically and more cataclysmically than anybody can imagine. Look around on the Web at the rudimentary artificial intelligences already being spawned from the http://www.geocities.com/mentifex/mind4th.html Mindmaker Project: Mind.Forth, Mind.Rexx, and Mind.VB in Visual Basic. Mind.Javascript and Mind.LISP are rumored to be in the offing. (Contrary to what you may read in the news:comp.sys.super forum on Usenet, Mind.Befunge is not seriously contemplated.) People who do not factor in the PD AI factor of unstoppable hacker-in-the-good-sense coding of Internet iMinds, are incapable of calculating and projecting the five- to ten-year short term future starting right now in the year 2000.

I bought an early PACTOR 1 unit from Pacomm, and it worked great - for AMTOR. It would monitor PACTOR QSO's, but I never managed to get an actual contact with it (PACTOR). I used it for AMTOR for a few months, then it went into the top shelf of the closet. It's still there.

The Pacomm folks offered to fix it, but I never sent it in for repair. That was my descision, so it's hard to fault Pacomm.

1853. HELP INFO-TECH (DES?) M-200F

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-03 00:00:00 UTC
From: dialta@aol.com
Message-ID: <20000503111615.05648.00001184@ng-cp1.aol.com>
Source record: 13039

I need help in finding the address of the manufacturer of the INFO-TECH M-200F digital demodulator. They used to be located in Englewood, Florida, and I believe their companay name is now "DES" (Digital Electronic Systems perhaps). I am in need of a copy of the Operating Instructions for their M-200F digital demodulator. If you can provide a phone number or address for DES, I would greatly appreciate it. Thanks! 73 Dick, K0VKH Mission, Texas (dialta@aol.com)

1854. APRS Protocol Specification: Third Draft

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-03 00:00:00 UTC
From: Ian Wade <Ian.Wade@care4free.net>
Message-ID: <z3yq6WAkSFE5EwoH@care4free.net>

Cross-posted to: rec.radio.amateur.digital.misc,uk.radio.amateur

```
======================
APRS WORKING GROUP
APRS PROTOCOL REFERENCE
THIRD PUBLIC DRAFT
======================
```

The APRS Working Group has now published the third (and hopefully final) public draft of the APRS Protocol Reference. It is available on the TAPR website, at http://www.tapr.org/tapr/html/Faprswg.html.

This latest draft incorporates *hundreds* of items of feedback received since the previous draft published last December, and has now grown to 115 pages.

Several sections have been considerably expanded and clarified. In particular, the chapters on Mic-E, Weather Reports and APRS Symbols have been substantially rewritten.

The Working Group invites feedback on the specification, although due to the extensive public comments that we have already received on prior drafts, we will not have a formal comment period as defined in the WG charter; what we ask for now are additional eyes to ensure that we haven't inadvertently introduced new errors to this draft. Comments should be addressed to the TAPR "aprsspec" mailing list. Details of how to join the list are given on page 2 of the document.

The cutoff date for feedback is midnight local time on Monday 15 May. Then, depending on the amount of feedback received, the Working Group hopes to publish the Final Approved version of the specification a few weeks later.

John Ackermann, N8UR
Administrative Chair, APRS Working Group

1855. Re: PacComm PacTOR Controller - JUNK?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-03 00:00:00 UTC
From: Rob <Pse@NoEmail.Com>
Message-ID: <X2ZP4.35239$Xk2.129799@tor-nn1.netcom.ca>
Source record: 13041

Hi Charles,

I had the same problem with my Pacomm. It worked okay on AMTOR and would monitor PACTOR.

But the Pacomm controller would not work in the PACTOR ARQ mode apparently due to RFI problems.

In AMTOR, since the transmissions (or chirps) in ARQ are so short, I suspect that any RFI feedback would not adversely affect the performance of he Pacomm controller on AMTOR.

But on PACTOR with the longer transmissions, I suspect that I had RFI feedback problems that ADVERSELY affected the Pacomm controller on Pactor. Lights would light up unexpectedly, links would drop quickly etc.

I returned my PACOMM Pactor controller to the dealer for a refund.

It is my understanding that Pacomm eventually solved these problems.

Having done this before I disagree that the details are a "piece of cake" but you may have a better understanding of the DTMF decoding requirements than I did. Here are a few specs for DTMF detection from http://www.ece.utexas.edu/~mason/codesign/dtmf.html The full spec is also available from this site, I think.

"Any frequency within 1.5% of the DTMF frequency should be detected. Frequencies with 3.5% error should never be detected. Inside the 1.5% - 3.5% range is a don't care. DTMF signals lasting 40ms should always be detected. Signals less than 23ms should never be detected. Inside the 23ms-40ms range is a don't care. DTMF signals that are interrupted for 10ms or less should not detect two separate signals. Twist is caused by a non-uniform power loss across the frequency spectrum. Normal twist is when low frequency power is greater than high frequency. Reverse twist is obviously the reverse condition. The detector must be reject 8db and 4db for normal and reverse twist respectively."

In my experience (having written a couple of DTMF decoders on DSP platforms) you should pay attention to the specs. Relaxing them can cause side effects such as increased "talk-off" or false detections due to speech or noise.

The link above might be helpful in implementing a decoder. There are references and even links to some sample code for DSPs. I believe the sample code uses a Discrete Fourier Transform (DFT) for frequency measurement.

All,
Has anyone tried with success any other program with the PK/HK
232mbx other than PKFAX for WEFAX? I know that there are a lot
of programs out there that use the sound card, but since I have
this box, I might as well put it to good use. I dug out my copy
of PKFAX the other day and loaded it into WIN98. I booted the
machine into DOS mode and executed the program. When I went into
Config, the video section does not have a choice for SVGA!
CGA,EGA, MONOCHROME all leave a blank black screen. Any thoughts
on this?

Hello Chris, Timewave has dropped all of the AEA DOS products in their line
because of Y2k and no support from Microsoft for the DOS OS. The good news is
that CSS <http://www.cssincorp.com> has done a modern windows based WEFAX
program. You can download a trial copy from them.

Yeah, I've found, that if I call CQ on HF, that I can
pretty consistently raise someone on Pactor -- though
sometimes it takes a long time. And, for calling,
sometimes it helps to run some power, even though
you may not need it to communicate, more people will
stop and try to decode if they hear a nice strong
signal. (At least this is my theory -- sometimes you
never know why they answer or don't answer. Ham
radio is weird that way.)

You can usually turn down the amp when you connect.

There is usually something going with the digital modes, especially the new psk31 mode. Tune between 14.050 and 14.100 and hear all the odd sounding signals. You can download some programs where all you have to do is connect to the speaker of the rig and plug it into the sound card on the computer. Almost no cost to just hear and if you want to transmitt, you need another plug to go to the sound card to the mic input and two resistors that you should be able to pick up for jsut a couple of bucks in packages that hold 5 or so.

FWIW, digital has been my main mode for the past 10 years. There is a LOT going on in digital. Right now, PSK31 is probably the hottest new activity in all of ham radio. It is a really cool keyboard-to-keyboard mode which is great if you don't have a huge antenna and kilowatt linear -- PSK31 really does well under poor band conditions and does sensationally well when conditions are good, as is the case much of the time these days.

As other on the group have probably told you, if you have a rig, an antenna, and a computer with a sound card, you can be up and running in PSK31 in an hour or so at no additional cost.

Pactor is another great ragchewing/dx mode, and there is quite a bit of activity on this mode as well. It is a high-speed mode designed for HF, and does well under the same sorts of conditions as PSK31, but generally at higher speed. Lots of activity, lots of QSOs.

Others can tell you about RTTY -- I have pretty much given up on that mode because PSK31 is really a better type of RTTY in my view at least.

1879. Need Antenna Manual for Butternut HF5V

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-06 00:00:00 UTC
From: johnl84238@aol.com
Message-ID: <20000506124957.07429.00001608@ng-cl1.aol.com>
Source record: 12965

I have an old Butternut HF5V which has been stored for years. I am trying to
get it going again, but I find I have lost the user/instruction manual....does
anyone
out there have a manual for the HF5V (it is a circa 1980 version). I would be
happy to pay for copying and mailing costs for anyone who may have one.
Thanks and 73,
John

1880. Announcing the APRS DECODER

Newsgroup: rec.radio.amateur.digital.misc

============================
ANNOUNCING "APRSDEC"
THE FULL APRS DECODER PROGRAM
by Ian Wade, G3NRW
6 May 2000
============================

While working on the APRS Protocol Specification, I found it useful to write an APRS
Decoder Program (APRSDEC) to verify the details of the protocol.

APRSDEC parses APRS packets in IGate output format, and produces a full decode of all
elements of each packet. This will be particularly useful for APRS developers/testers, and
also for people who need/want to know more about the protocol, or who want to check out
their own packet formats.

Among the more obscure formats, APRSDEC fully understands Mic-E, compressed positions and
area objects (circles, triangles etc).

Here is an example of APRSDEC output:

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
APRSDEC. APRS Packet Decoder.
Version 1.0.1b (5 May 2000)
by Ian Wade, G3NRW (g3nrw@arrl.net)

Runtime = 06-May-2000 16:13:21
Input file = examples.log
Output file = examples.out

NOTE: If this report contains anything that you think is incorrect,
please email it to g3nrw@arrl.net for investigation. Thank you.

++++++++++++++++++++ END OF INPUT FILE ++++++++++++++++++++

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
```

With a few unimportant exceptions, APRSDEC understands all of the APRS features included in the Protocol Specification. As an extreme example, look at Record #7 above. This draws a line object with a 10-mile corridor either side, and is carefully contrived to cross both the Greenwich Meridian and the Equator -- the offset posit shows the position of the end of the line, in the opposite latitude and longitude hemispheres.

APRSDEC even recognizes Kenwood TM-D700 radios, and corrects the posit to be a *current* posit rather than an *old* posit. Position ambiguity (Mic-E and uncompressed lat/long) is also handled correctly.

APRSDEC includes extensive error reporting, showing for example when a parameter is out of range, or in is the wrong format, or (in the case of NMEA sentences) where there is a bad checksum.

APRSDEC is now available at http://www.netro.co.uk/aprs.htm

This is the first publicly released version, and I would welcome any feedback, especially if you find any errors.

With PSK31, you can turn the amp off. There's no need to put a lot of power into it. Same with Hellschreiber. Last weekend I had a 3,000km contact on Hellschreiber where power output was 150mW here and under 500mW at the other end with perfect copy (on 12m).

APRSDEC is released as a compiled BASIC program right now. It runs in a
DOS/Windows environment.

My intention is to release the source as soon as it has shaken down --
there are a few things I want to add to it before then, and there are
probably still some bugs in it.

There will not be any charge for the source (in fact, users will
probably want to charge me for having written such awful code ... :-))

Well, when it is a BASIC program for the DOS/Windows environment, users of
other environments probably will not be able to use it anyway...
(aside from running in an emulation environment)

To program a tool like this a bit more platform-independently without
having to go back to C or C++, try Perl.

You're right, of course, Rob.

But in the README I said that it was developed for my own benefit
alongside writing the protocol spec. It was not originally intended to
be a "useful" tool for "general" use ... :-)) If I started again, I
would almost certainly use Perl.

Of course you did not claim it was platform-independent... but apparently
others think it would become platform-independent by releasing the
source...

How did that become apparent to you? I missed it.

Anyone who can not deduce the alogrithms from documented BASIC source
code and implement this program in the language and environment of
their choice is a person would not know what to do with any source
code in any language.

Posting this in a ham radio group is insane.
Hams have no interest in sex.

Please visit my World Wide Web Site, you have never seen a page like it. You
will see:

1. Access to oldies mp3 (albeit on an irregular basis)
2. Really interesting answering machine messages
3. A blond naked chic being held by a female ham!.
4. A guide to the best ham pages ever.
5. Hear Ted Kennedy really screw up in front of Clinton
6. Actually sounds of Bill Clinton "after the lov'in".
7. The writings of me and others on ham radio, hear a typical ham contact.
8. The warm side of K1OIK, hear me speak, see me with famous people.
9. An amazing card game that will shock others
10. Pictures of me and my family.
11. Did common German's enable the holocaust?
12. See now the future of ham radio.
13. How to pass the A+ Certification

Burt Fisher
A Plus Certified Teacher of video, broadcasting and electronics
Amateur call South Dennis, Ma. (Cape Cod)

I am not sure if this is the right group to post this, so if not just tell me and I will post it in the correct group

Here is my question:
I would like to build a network with the guy down the road, the problem is that we can't lay cable to each others houses. I thought about this a little and I was wondering if it was at all possible to link our computers via a radio of some sort. I am only new to this, so any help will be greatly received.

In terms of the physics, yes it is possible, but you first need to
contact the Australia Communications Authority to determine the
licensing requirements for such a venture.

Exactly my thoughts. BASIC is exactly what its names implies - basic!
Anyone with a reasonable level of programming skill can convert BASIC
source code into 'C' or any other language.

(I wonder how many of those who have contributed wise words (?) to this
thread have looked at either the APRS spec or Ian's program?)

Aaah. There's a problem here. My BASIC source code is *not* documented ...
And it contains 319 GOTOs. I said it was awful.

[Actually, Rob has got me going now! I'm going to re-code this thing in Perl].

Greetings and thanks for reading this...

I am in the process of trying to get LinKT up and
running for packet under RH-6.1.!!
I have obtained AX25SPYD and the other related files needed for the
install. I successfully installed and compiled ax25syd without any
errors. When it came to installing LinKT, it couldnt find that I had
installed AX25SPYD. The resulted in it not installing using RPM that
is.

I have got the ax25-utuils and ax25mail-utils installed
no worries.. ax25-utils-2.1.42a and ax25mail-utils-0.10. I have used
Linpac and tnt both with this system, so I know that both tnc and AX25
are not causing problems... I would like to find someone who has
installed the program [LinKT] successfully and is using it as their
packet program..

Many thanks for reading this and look forward to a reply....

Oh, but the algorithms can already be deduced from the APRS spec!
A piece of ready-to-use source can be useful for many more people than
those who would want to code it.

> is.
Our rpms are from SuSE, I am not sure if the work under RedHat. You can try
it by using "rpm --nodeps --force -i linkt-0.6.2-6.i386.rpm".

Or compile it yourself, you need the xdevel, qtdevel packages, then
configure it using
./configure --with-ax25-utils=/usr/src/ax25-utils-2.1.42a/,
then "make && make install". Or install the new ax25-libs/tools from
http://hams.sourceforge.net.

You don't need ax25-mail-utils (yet) for linkt, and the ax25-tools
/libax25 packages are better than the older ax25-utils.

Message-ID: <trqR4.37420$Xk2.135840@tor-nn1.netcom.ca>
Source record: 12986

Hi Marty,

A lot of HAM's would love to have PACTOR software for a sound card that runs under Windows.

It is VERY difficult to implement the BURST modes, like AMTOR and PACTOR under Windows (even using some of Windows advanced features like DirectX). ARQ Timing is critical in the burst modes in order to maintain a link. Unfortunately, Windows is a TERRIBLE Operating System (OS) for applications where timing is important. (Even when DirectX is used by games, it is not that important if timing is off 10, 20 , 30 ms etc but with PACTOR and AMTOR that is a different story!). Linux and DOS are better.

To my knowledge, there ARE only THREE sound card programs for PACTOR and a sound card. One program runs under Linux. The other two run under DOS (where you don't have all those nasty Windows interrupts messing around with your timing!).

I do not know of ANY programs that run under Windows. (It may NOT be technically possible to write RELIABLE Pactor software for a sound card and Windows due to the nature of Windows).

The Linux program is FREEWARE. I have not used it (or Linux).

The first DOS program is SHAREWARE and was written by K6STI. It is called RITTY version 2.xx. K6STI later released RITTY ver 3.xx without PACTOR.

RITTY ver 2.xx requires a TRUE Sound Blaster Card (NO CLONES). A lot of Hams really like RITTY ver 2.xx on Pactor. But I have heard that it may not work on some TRUE Sound Blaster cards due to variations in quality of the various Sound Blaster Cards.

In any event, K6STI may not even sell licences anymore to his RTTY and Pactor version (ver 2.xx). If you are interested, write him a letter.

The second sound card program is FREEWARE and was written by Tom Sailor HB9JNX. It is called TERMPSA and runs under DOS. (see http://www.ife.ee.ethz.ch/~sailer/ham/ham.html)

TERMPSA requires a sound card with PSA architecture. The PSA sound card relives the main CPU of some of the critical timing tasks etc. Unfortunately most sound cards do NOT use PSA. And you cannot buy PSA sound cards anymore. For most people, this is NO longer an option.

However, there are other options for a low cost PACTOR solution, :

OPTION 1: You can buy a second hand multimode TNC off EBAY, etc. But BEWARE, NOT all multimode controllers are EQUAL when it comes to Pactor.

You will see many PK232MBX's and KAM PLUS's for sale on EBay and at Flea Markets. In my view, AEA did a much better job at implementing PACTOR in the PK232MBX than KANTRONICS did with their KAM PLUS. (But I like the KAM PLUS better for packet with its dual ports etc!). You can also buy a DSP filter upgrade for the PK-232MBX. It does NOT turn the PK-232 into a DSP controller but does improve the filtering.

In particular, I would avoid the HAL DXP-38. In my view, HAL has done a poor job at implementing Pactor (which Hal calls P-MODE) in its DXP-38.

In my view, the best Pactor controllers were made by SCS, the inventors of Pactor! But the SCS TNC's are rarely seen on Ebay etc. (For Pactor 1, the SCS PTC 1 is great. For the FANTASTIC Pactor II mode, there are only two choices, the SCS PTC II and PTC IIe)

If you buy a second hand multimode controller (like the PK232MBX etc), don't be surprised if you need to buy a firmware upgrade from the manufacturer for PACTOR. Many of the TNC's sold on EBay etc have old firmware without Pactor. (For prices for the AEA PK232MBX upgrade see www.timewave.com and for prices on KAM upgrades see www.kantronics.com)

OPTION 2: Use a conventional modem that converts the mark/space tones into RS-232 levels for your computer with DOS based software that implements the Pactor 1 protocol. You have two options. You can use TERMAN93 by Tom Sailor (http://www.ife.ee.ethz.ch/~sailer/ham/ham.html) It is FREEWARE.

Or buy BMK-MULTY software for DOS. I have heard that BMK-MULTY is very good. See http://www.bartg.demon.co.uk/Sales/index.htm

OPTION 3: Buy a PTC IIe or PTC II from SCS. The PTC IIe and PTC II are great modems that give you Pactor 1 and Pactor II. Pactor II is amasing. You won't regret buying a SCS PTC IIe or PTC II but they are pricey! see www.scs-ptc.com. PACTOR II is very fast and works very well under VERY poor conditions. You have to see it to believe it. Go for OPTION 3 if you can afford it!

Good luck and 73's,

Rob

Marty,

There is software for packet and a sound card that runs under Windows.
Packet is not that timing sensitive.

For Windows 95, try FLEXNET. (see
http://dl0td.afthd.tu-darmstadt.de/~flexnet/)

FLEXNET may NOT run well under Windows 98. Apparently, FLEXNET for Windows
98 is coming soon.

For Windows 98, try AGW packet engine. See http://www.raag.org/sv2agw/

Also try MixW32 for RTTY, PSK31 and HF/VHF Packet! See
http://tav.kiev.ua/~nick/my_ham_soft.htm and
http://users.nais.com/~jaffejim/

(MixW32 will ALSO receive Pactor BUT it will not transmit Pactor. As I
mentioned in my earlier post, this is not surprising!)

1902. PackRatt vs PKTerm99

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-07 00:00:00 UTC
From: Rob <Pse@NoEmail.Com>
Message-ID: <tEqR4.37423$Xk2.136593@tor-nn1.netcom.ca>
Source record: 12988

Hi,

I am considering purchasing either Packratt II for Windows or PKTerm99 for Windows for use with a PK900.

I understand that Packratt II for Windows is a 16 bit application. Does it run under windows 98??

Has anyone used both programs?? Which is better??

73's
Rob

1903. WEFAX and SSTV software for PK900??

Newsgroup: rec.radio.amateur.digital.misc

Message-ID: <NJqR4.37428$Xk2.136656@tor-nn1.netcom.ca>
Source record: 12989

It looks like the PK900 has a pretty good built in analog and FAX modems for SSTV and WEFAX. But I have been unable to find any programs on the web.

Does anyone know whether there are any Freeware or Shareware programs that will receive and transmit SSTV and 256 grey scale WEFAX using the PK-900's built in analog and FAX modems??

Rick,

Thanks for the info.

But until you enhance PKTerm99 with all the features in Pacratt II for windows such as two modem support etc, PacRatt II for windows appears to offer more.

You can always buy PKTerm99 wand wait for these enhancements. But you will have to pay for the upgrade later on!. (Unless you will offer a FREE upgrade later on to all registered users of PKTerm 99).

I can see your point regarding whether it is a good business decision to develop WEFAX software for the PK900. But WEFAX software is not that difficult to write. Hams have written simple FAX software themselves. SSTV is a little more complicated. (It is too bad that the PK-900 did not use a JVFAX compatible protocol.)

But what about AEA FAX 900?? It is a 256 grey level FAX program for the PK900. Isn't it still around??

Rob,

We own the source code to both. PakRatt 2.1 is a 16 bit app, which will run under Windows 98, but we're not doing any future development on it and Timewave will discontinue selling it later this year. We're taking all the 'best of' PakRatt and moving it into PkTerm and will continue development on it.

Either way you go, you get to work with us!!! <grin>

FYI on the Wefax stuff, right now the only support is for the 2 color wefax mode on the pk-232/PK-900. We're working on the 256 shades of gray for the PK-900/DSP-2232, but the market is so small for those units (only about 2000 total), we're wondering if we can recoup the development costs for it.

Rob,

I thought you knew our policy. Free 1.x upgrades of the PKterm and Pacterm product. To support two modems now, you can install PKterm in two different directories with no problem running both at the same time. it's a pretty major rewrite of the parse code and user interface code to do that directly, but it is something we're going to add in a future release.

What other PakRatt features do *you* want in PKTerm?

AEA FAX is DOS program that didn't use the Analog mode of the PK-900, it used the DTR like (like the hamcomm interface). It was licenced from a British company and no one seems to the know that status of the program, since Timewave doesn't sell it.

Don't be misled. Visual Basic is a fully-featured
professional language. If you've got a copy of IE5,
Word, Excel, Access, Outlook, then you've got a
working programming language thrown in for free.

(In the case of IE5, you've also got JavaScript)

1908. Details needed, RS232 port to NEC pager

I have an NEC Message Maker II pager, model PN5PY22B. I would like to program it via my computer's serial port, I have the software, however I can't find the hookup details needed. I need the pin out for the pager's side of the deal. Under the battery cover there is a bit of circuit board and what appears to be four programing contacts. This is a synthesized pager therefore the frequency of this pager is programmable within the 900 MHz paging band. Also wondering if re-tuning will be needed after programming the frequency? Anyone know what the details are?

Thanks,
Dr.D

Even worse: it is constantly waiting in the background for documents
that contain Basic statements, and will activate to execute these.
Including statements that execute arbitrary other programs, overwrite
any file on the system, send mail to all contacts in your address book,
etc.

Don't tell me it isn't true, we have CNN here as well!

This is one of the reasons why I don't have a copy of IE5, Word, Excel,
Access or Outlook (versions after '97) on my system!

After looking at the DigiPan log, I find that it's in ADIF format, allowing it to be imported into many of the current logging programs. I use Prolog2K and was able to import the Digipan log directly into a log database. Only one problem - Prolog2K was confused by the mode of "BPSK" and assigned a mode of FAX to all the contacts. Other than that, it worked just fine.

PSK31 is a very good mode. But I like PSK-HELL mode better.

In my view, PSK-HELL is more sensitive than PSK31. Under really bad conditions, you will be able to copy PSK-Hell since the eyes make the final decision on each character sent! (That is why some folks call the Hell modes -- FUZZY modes). PSK-Hell also handles polar flutter etc better than PSK31.

Try IZ8BLY's great Hell program for windows and a sound card. It is FREE!

>Hello Rob,

You are correct, Ratt is a 16-bit application that will run under 95/98/2000.
But like all 16-bit aps its days are numbered. We don't plan on further
enhancements for Ratt, rather the time will be spent on improving PK Term 99.
There are a couple of features in Ratt that are not in PK TERM 99yet,
parameter handling and running 2 TNC's simultaneously (Thats up to 4 radios
with a PK-900 or DSP-2232) but they are in the enhancement plan. I switched
about a year ago and like the fact that PK TERM 99 is a real 32-bit Windows
program written by programmers that really know the Windows OS.

Term also couples with Log Windows for a really slick digital station.

Which license will you use for the source code? Please consider
the GNU General Public License (http://www.gnu.org/) or at least
something compatible with the Open Source Definition
(http://www.opensource.org/). Otherwise a lot of people will have
to rewrite the code under a better license.

Only if done badly in Perl. It's a common myth that no Perl code
is self-documenting. As someone who has been writing Perl non-stop
for the past few months, I can tell you that's no more true of
Perl than it is C or Pascal, etc.

Anything has to be better than Forth.
After four or five hours I can't tell
low level forth I have written and debugged
from transmission line noise.

Using BASIC is a moral position.
I will not write in anything called
"BEGINNERS All-purpose Symbolic
Instruction Code" at my age 8-)

Rob,

We own the source code to both. PakRatt 2.1 is a 16 bit app, which will run under Windows 98, but we're not doing any future development on it and Timewave will discontinue selling it later this year. We're taking all the 'best of' PakRatt and moving it into PkTerm and will continue development on it.

Either way you go, you get to work with us!!! <grin>

FYI on the Wefax stuff, right now the only support is for the 2 color wefax mode on the pk-232/PK-900. We're working on the 256 shades of gray for the PK-900/DSP-2232, but the market is so small for those units (only about 2000 total), we're wondering if we can recoup the development costs for it.

1925. New Resource For Investors

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-09 00:00:00 UTC
From: meir@investmove.COM
Message-ID: <V3R21Y2X.BS30UJ8I@investmove.com>
Source record: 12911

Hi,

I would like to introduce our new site and kindly request
that you add InvestMove.com <http://www.investmove.com>
to your Links/Resources page (or please forward this message
to the person who is responsible for maintaining your Web
site). This will provide your visitors with a very useful
and information packed resource. InvestMove.com allows
investors and analysts free access to vital stock market
information.

In recognition of its usefulness, InvestMove.com has been
awarded recently with the prestigious USA Today Hot Site award.

InvestMove.com features a unique tool that allows visitors to
enter a company symbol into a search form and obtain a customized
page covering more than 30 major information categories about
that specific company. The information includes: stock quotes,
stock performance, earnings estimates, stock valuation, company
performance, analyst opinions, broker reports, company profile,
and much much more.

Another feature of the site is an investor resources directory
that includes links to the best investment sites on the web.

Linking to InvestMove.com helps you to add value to your website
by presenting your visitors with a useful free investor resource.
Your visitors will find here all the tools and information needed
to make educated investment decisions, and it's all completely free.

In addition, links to relevant and popular sites are known to
increase a Web site's "popularity ranking" in some major search
engines. In other words, linking to http://www.investmove.com may
actually help increase your Web site's rank in certain search engines
that record this external link.

Thank you in advance

Meir Liraz,
InvestMove.Com

Hi Rick,

I am glad you are considering adding two modem support in PKTerm99. For
many Hams, that feature is important. Since the PK-232 is NOT a TRUE dual
port TNC, there are many Hams who use two PK-232's -- one for RTTY etc and
another for packet (DXCluster etc). I am sure that is one of the reasons
why Packratt for Windows had this feature.

Multi modem support, PSK31 support, new CQ, ID and QRT macro support, packet and HF settings pages for all settings, telnet support.. so many things we have in the plan for Pacterm/PkTerm, etc.

We're also about to release a new version of Logwindows for Dayton. That's been our focus the past few months.. bunch of new stuff there.

I'm determined to make good quality ham software, the hobby deserves it.

Hi Dick -

I've been running a very sooped up Henry 2-KD Classic within 2 feet of my monitor (MAG DX 1757) and 3 feet from the computer CPU (Generic pentium II-300) and printer (new HP-P-1100) for about 3 years with no problems. The radio, an IC-781 is between the monitor and amplifier. That is to say, no problems after proper grounds were made.

I run about 15 radio telephone phone patches a day at full power (~3500 watts PEP) on commercial & Navy MARS bands. Not much Ham stuff though.

A good RF ground is the key. I use a liquid RF ground (Polyphaser) that uses 2 ground rods, one which is a Polyphaser, and the other is a regular 8 ft ground rod. The two rods are separated by about 10 ft. and I assume that both rods are in the liquid that spreads out under my garage slab. Both rods are interconnected.

All equipment, radio, amplifier, tuner, monitor, computer, phone patch, etc. are connected to a common ground buss that connect to the ground rods. All equipment connections are with 3/4 inch copper plumbers tape.

If one forgets to hook up one of the ground leads, I know about it almost immediately. My wife will complain that the phone is screwed up, or the computer goes wild at transmit time.

Also, invest in a hand full of Amidon HF ferrite beads. I think that the proper beads for HF are #77 mix. They work wonders on telephones, computers (if you need them), TVs, etc.

Regards,
Bannister Bray, WB6GUI

This could have been a trivial task if you would provide the SRPMs
aswell...
Than someone with RH linux could make new RPMs. So every one of us has
to go through
the tedious task of doing everything by hand...

We don't make the packages ourselfes, they are built by SuSE, so the
sourcepackages are available from every suse-mirror, e.g.
ftp://ftp.gwdg.de/pub/linux/suse/6.3/i386.de/suse/zq1/linkt.spm

Hmmm... That should actually be saying that any Palm-based *terminal emulator* program is a pain to use only because of the differences in the size of the display... I actually find most of my Palm programs very easy to use...

I really need to proofread better before clicking send!

Tsk Tsk(on me)...

1939. RTTY with Pegasus/PK-232

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-10 00:00:00 UTC
From: Dennis Mueller <Dennis_Mueller@email.msn.com>
Message-ID: <OKKvScuu$GA.235@cpmsnbbsa03>
Source record: 12925

I am trying to connect a AEA Pakratt 232 TNT to my Ten-Tec Pegasus using the Pegasus Accessory cable. Whenever I connect the 232 to the Audio In of the Pegasus (Black connector), the radio switches to transmit with no power out.]

I had the same problem when I fed audio from my sound card to the Audio In connection.

The 232 "receives" audio quit well from the Pegasus when the Audio In to the Pegasus is disconnected, so I believe I have the audio lines connected properly.

I called Ten-Tec but they said they had never heard of the problem and had no suggestions.

Has anyone experienced this problem? Any help is greatly appreciated.

73,
Dennis N6IH

1940. Re: Wanted - Interface

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-10 00:00:00 UTC
From: Phil Gagner <gagner@svg-law.com>
Message-ID: <391a2058.0@news.kivex.com>
Source record: 12926

It's not clear from your post precisely what you want to do. I've interfaced my 706 mkii to a soundcard, using quite simple circuitry.

1. I didn't want to direct connect the radio to the computer, so first I tried a simple audio transformer. I had one laying around, but had no idea what the specs for it were, so I just decided to try it. It worked, although there were problems with adjusting the level for the best results. So I replaced it with another which seemed to be a 1:1 audio transformer. I put it in line with a 10K pot and it let me read PSK31 and try the various weather map, CW and RTTY programs available. The wiring couldn't be simpler--I didn't have a DIN plug that would fit the back of the 706, so I rigged up a piece of plastic with holes in it for wires to stick through, and pushed it against the DIN socket and fastened it with electrical tape. The purpose was to keep the wires from falling out, and it worked fine. I've since replaced it with the appropriate DIN plug, which works just about as well, but gives me a more secure feeling

2. Wiring is simple--check the manual that came with your 706. You'll need to connect ground and AF-Out to one side of the transformer, and run a pair of wires from the other side of the transformer to a plug that fits your soundcard. . For my 706 mkii, pin 2 was ground and pin 12 was AF-out. If the transformer doesn't work one way, try it the other way. The purpose of the pot is to avoid overloading the soundcard. You may not need it at all, but then again you may. Presto, you're receiving the radio's audio into your computer, and can play with the programs. That's all it takes to get this far, and it's less than 15 minutes worth of kludge-building. I used cheesy wire and a plug cut from a cheap earphone, and it worked okay (you'll want to use better later).

3. You have to use the level adjust on your soundcard, and you probably aren't in the best range. As mentioned, I didn't bother with shielded cables at first, because I just wanted to see if it would work at all. It worked pretty well, actually, and I could read weather maps and try various PSK31 and RTTY programs, as well as several CW decoding programs, just for fun.

4. The next step is to build a level adjustment onto the audio. I built a level control using a fixed resistor and a potentiometer as a voltage divider, and it worked fine. Component values are not at all critical--try several combinations and see what works. I found that about half a volt drives my soundcard perfectly, so just tune to a strong and steady signal on the radio, and then measure the voltage. Then toss together a voltage divider that gets you that voltage. The values really are not critical as long as you're within range of the pot.

5. An alternative I've seen is to skip the transformer altogether and just use a voltage divider circuit direct to the soundcard. I don't like

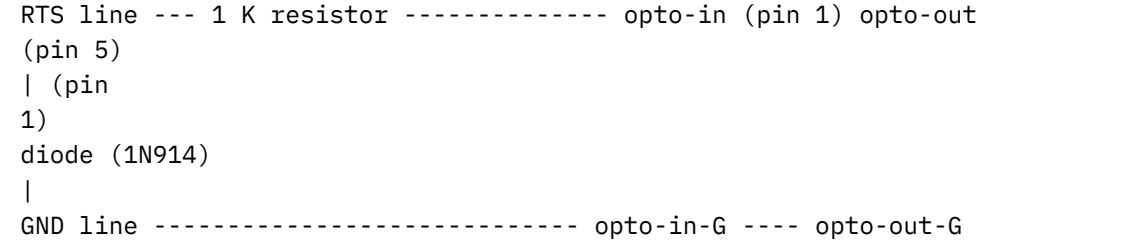
this approach because it seems chancy to tie the radio to the computer too tightly. The radio puts out 100 watts of RF from time to time, and who needs that floating around inside the computer? Still, it works for some folks. Some folks reportedly just use a straight wire with no fancy electronics. I'm not that brave, and besides I like to twiddle with the pot to convince myself I'm improving the reception.

6. Now we've got the radio audio going to the computer, so the next step is to enable transmit. After all, we're hams, right? I mean we went to all the trouble to get the license, so we should be able to transmit. Now it REALLY depends on what you're trying to accomplish. I wanted to be able to get the sound card output into the radio audio input, and I still didn't want to have any copper paths running between the two expensive pieces of electronics. So again, one approach is to use a transformer. Again we want to be able to twiddle, so we use a pot as a voltage divider. I'd stick in a 100 ohm resistor after the 50K, just to be sure we weren't shorting to ground when the pot is zeroed. The yellow and red wires of the transformer would go to the soundcard, and the white and black wires to the radio.

7. So now we have the audio out of the soundcard driving the audio in of the radio. Again we wire it to the AF-in pin on the back, either with a kludge or with a real DIN plug. Problem is, the radio won't know when we want to transmit, because we haven't "pushed" the PTT button.

8. When the computer feels like transmitting, it needs to put a voltage on the right pin whenever we want the radio to transmit. The signal has to come from somewhere, and this time it can't be the soundcard. So we'll need to steal a signal from one of the COM ports to do it (we could use a LPT port as well, if we had an extra one). Generally COM1 is the mouse, so we'll use COM2. If you have a modem on COM2, then you may need to install another soundcard (of course, if it's an internal modem, then just change the settings of your BIOS if you're using WinDos). We'll want to steal the signal from the RTS line of the computer's COMP port, which is pin 4 if you have the big connector (DB25) and pin 7 if you have the small (DB9) connector on the back of your computer. Ground is pin 7 on the DB25 and pin 5 on the DB9. Buy the right connector or cut an old serial cable and find out which wire connects to RTS. We choose RTS only because that's what most of the software seems to want.

9. Now we have to get that signal into the radio. Again I didn't want to make a direct connection. The COM port signals are 12 volts, plus for ON and minus for OFF, so I used a device called an opto-isolator, which uses a back to back LED/phototransistor. It's like a transformer, but for DC voltages. The circuit looks like this:



(pin 4)
(pin 2)

The diode prevents the negative 12 volts from getting to the opto-isolator. The 1K resistor (anything from 1K to 2.2K will work) puts a load on so we're not shorting the COM port when it puts out the negative 12 volts for the OFF state. Pin 4 of the opto-isolator connects to the radio connector ground. Pin 5 of the opto-isolator connectes to the PTT line of the radio. Now whenever the RTS line turns on (i.e. +12v), the radio transmits. You REALLY want to have a switch between the opto-isolator and the PTT line, because otherwise your radio may transmit when you don't expect it. When you're using the computer with the radio, turn the switch on. (Remember if you have your mike plugged in, and if you're transmitting in a mode that can use the mike (SSB, AM, FM, ...), you may be transmitting through the mike as well.)

10. The last step is to replace all the cheesy wiring with higher quality shielded cable to reduce stray RF. I mounted the two transformers and all the other parts in a little box. Finally, I added a red LED to tell me when the circuit is trying to tell the radio to transmit and a nice green LED with associated circuitry (one transistor and a few resistors) to tell me when the radio thinks it is receiving a strong signal. These blinkity lights really serve little useful purpose, but I like watching lights blink.

Anyway, all that worked like a champ for me. I had everything laying around except the opto-isolator, which I had to order from DigiKey. Radio Shack carries the same one, as do lots of other places. The whole thing should cost less than $15, and if you add the switch and case, less than $20.

You can find various other circuits on the web, including:
http://www.w5bbr.com/soundbd.html

One last tip -- you'll really want to control the radio frequency and so on from the computer too. That requires a CI-V interface, which you can buy from ICOM for about $130. Or you can build this too. The ARRL handbook has one which works well, and costs just a few dollars to build. Yaesu sells an interface for its handhelds, which it calls an ADMS-D or ADMS-E or something like that, which is $39. This works equally well (I've used it with my 706) except you have to rewire the plug (if you actually have a Yaesu handheld, then don't rewire the plug, just build a cable with a female on one end and a male wired correctly on the other). Why anyone would pay $130 for a cable that costs maybe five bucks to manufacture is past my understanding.

73 and good luck.

Phil Gagner/ KE4PDP/AE

Meaning that you don't want to buy their equipment, you want to steal
their design and build your own?

I can't help you, but maybe you can get one of these sites to copy the
schematics and send them to you:

Jim,

To find ANY ham radio program for Linux, see http://radio.linux.org.au/.

You will see packet programs, terminal programs etc for Linux.

For the link to the RTTY, PACTOR program for Linux by HB9JNX see
http://radio.linux.org.au/pkgdetail.phtml?sectpat=All&ordpat=title&descpat=p
actor&pkgid=65

Hi Gang,

This "true" notebook PC (just a couple of pounds and only 1.5 inches high, closed) has a 16 shade VGA monochrome screen and can run on 12 VOLTS!!! It works well with DOS versions of APRS, PC-Pakratt, Log-Eqf and my Icom radio control program. It makes for a dandy Packet/Pactor station on Field Days. See it (and all the accessories) at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=330799362

Bidding starts at $9.99, thanks for looking!

Radio Randy

Make $1000 of an initial $6 investment very easy, not a scam, really works!

Make Money Now! It doesn't get any easier than this. Just follow this awesome money making program, and you'll be collecting a nice supplemental income in no time. You don't have to buy anything! You don't have to sell anything! This is not a Paid To Surf Program or a Paid to Click Program. You don't have to surf the Internet for a ton of hours or click on little banners a million times. This program is fast, simple, easy, and most importantly....IT WORKS!

Mission: To make a one time investment of $6.00 and have it return to you over $6,000.00

The program really works! Read this testimonial first!
A little while back, I was browsing through newsgroups and websites, just like you are now, and came across an article similar to this. It said that you could make thousands of dollars within weeks with only an initial investment of $6.00! So I thought, "Yeah right, this must be a total scam." But like you and me, i was curious, so i kept reading. Anyways it said that you send $1.00 to each of the 6 names and addresses stated in the article. After you send the mail, you then place your own name and address in the the bottom of the mailing list and post the article in at least 200 newsgroups. No catch, that was it. So after thinking it over and talking to a few people about it, I figured, "what have I got to lose other than $6.00 and a few stamps?" So I decided to try it and I mailed out my measly 6 bucks. Well Guess What?! Within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon, but the money just kept coming in. Mail after mail with a 1 dollar bill inside. In the first week, I made $25.00 - Wow, I already made back my initial investment with some extra lunch money. But next week came more mail. By the end of the second week, I had made over $100! In the third week, I had over $1200.00 and it was still growing. By the end of the 4th week, I had well over $6,000.00! I couldn't believe it. It was certainly worth $6.00 and 6 stamps. And the best thing - it's perfectly legal! Thanks a bunch to everyone involved!

Important: This is not a rip-off; it is not indecent; it is not illegal; and it is 99% no risk - it really works!
Please note: Please follow the directions EXACTLY, and $6,000.00 or more can be yours in 20 to 60 days. This program remains successful because of the honesty and integrity of the participants. Please continue its success by carefully adhering to the instructions.
You will now become part of the Mail Order business. In this business

your product is not solid and tangible, it's a service. You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists. However, the money made from the mailing lists is secondary to the income which is made from people like you asking to be included in that list.
4 Basic Steps to Success
STEP 1 : Get 6 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Write on each piece of paper your mailing address and your email address. Now get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent thievery). Place one paper in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase with
your house and email address. What you are doing is creating a service. THIS IS ABSOLUTELY
LEGAL! You are requesting a legitimate service and you are paying for it! Any doubts? Please refer
to Title 18 Section 1302 & 1341 of the Postal lottery laws or call the US Postal office at 1-8000-725-2161.
STEP 2 : Mail the 6 envelopes to the following addresses:

1) Christopher L. Sloan
2200 Hickory St.
H.S.U. Box #14579
Abilene, TX 79698

2) Karen Lohning
155 Blue Spruce Ct.
Delaware, Ohio 43015

3) B. Stoltenberg
7149 Wynter Way
Indianapolis, IN 46250

4)J. Hanan
10871 Poyntell Cir.
San Diego, CA, 92131

5)Rob Barnes
14575 Spingvale st.
Poway, CA, 9206465t

6)Eric Larose
17757 Corazon Pl.
San Diego, CA, 92127

STEP 3 : Now copy this list and take the #1 name off the list that you see above and move the other names
up (6 becomes 5, 5 becomes 4, etc...) and add YOUR name as #6 on the list.
STEP 4 : Change anything you need to, but try to keep this article as

close to the original as possible. Now try to post your amended article to at least 200 newsgroups (chat rooms, message boards, guest books, bulletin boards...u know). You don't have to post 200, you can do more or less, but remember, THE MORE YOU POST, THE MORE CASH YOU MAKE! Keep a copy of these steps for yourself, and whenever you need cash, you can use it again, and again.
PLEASE REMEMBER : This program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions. Loook at it this way. If you are a person of integrity, the program will continue and the CASH that so many others have received will come your way.
NOTE : You may want to retain every name and address sent to you, either on a computer or hard copy and keep the notes peple send you. This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft. So, as each post is downloaded or read, and the directions carefully followed, six members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the #1 position you will be receiving thousand of dollars!! What an opportunity for only a one time investment of of $6.00 and six stamps. Send it now, add your own name to the list, post it, and you're in business!
To make sure you don't get into trouble with Uncle Sam, make sure you declare your extra income. Remember, this is LEGAL> You are using the Internet to advertise your business. What is that business? You are creating a mailing list of people who are interested in home based computer and online business and methods of generating income at home. Remember, people send you a small fee to be addesd to your mailing list. It is legal. What you do with your list of names is up to you. so build your mailing list, keep good accounts, declare your income and pay your taxes. By doing this you prove your business intentions.
How Much Can I Really Make?
Out of 200 postings (which should take no more than 1 hour) you receive only 7 replies (a very low percentage). So then you just made $7.00 with your name at #6 on the letter. Now each of the 7 people make around 200 postings with your name at #5 and 7 more people respond, you just made $49.00. Now those 49 people put up another 200 posts each, and still only 7 more reply from each person, you just made $343.00 with your name at #4. Following the same pattern, you would make $2401.00 with your name at #3, $16,807.00 at #2, and $117,649.00 at #1. And remember, that's only if 7 people reply each time!
Additional NOTES :
1) In some countries, the export of the country's exchange is illegal. But you can get the license to do this from the post office, explaining the above statements (that you have an online busines, etc.). You may have to pay an extra tax, but that's OK, the amount of the incoming CASH is HUGE!!
2) You may want to buy mailing and email lists for future CASH, or

database of spreadsheet software.
3) You may eventually want to rent a P.O. Box due to the large amount of mail you will receive. If you wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it. Just make sure all the addresses are correct.
4) If you're really not sure or still think this can't be for real, please print a copy of this article and give it to someone who really needs the CASH, and see what happens.
5) For a business to be successful, be honest and fair.

The myth is that Perl code is unmaintainable; that it is impossible to write code which will be understandable a few months later. This is no more true of Perl than any other language, if done carefully. Anyone who makes a comment like this simply has not invested the time to learn to use Perl properly. I find it to be a most impressive tool.

Popular logging product gets many new improvements

Muscle Shoals, Alabama. May 12, 2000: Creative Services Software announced that the version 3.07 of the popular logging program, Log Windows has been released. Log Windows version 3.07 is the first major functional upgrade for the product in almost two years. In January 2000, CSS started developing, selling and supporting the product and did a minor update for release 3.06.50.

Log Windows 3.07 includes the following new features:
- Telnet DX Cluster Access
- Support for new radios, including the IC-756 and the TenTec Pegasus (direct support)
- New logging mode options
- IOTA Support
- WinQSL QSL Manager Support
- QSLMaker 2.3 QSL Printing Program Support
- Full ADIF support

The product retails for $69.95 and upgrades from release 3.06.15 or earlier are $40.00. Those who have purchased version 3.06.50 will get this upgrade free. It also appears on the Digital Trio CD .
Log Windows is owned by SCO, Inc and is maintained by Creative Services Software.

Creative Services Software is at http://www.cssincorp.com
The Log Windows homepage is at http://www.logwindows.com
SCO, Inc is on the web at http://sco.home.mindspring.com/lw.html

Windows, Windows 95, Windows 98 and Windows NT are Registered Trademarks of Microsoft Corporation.

Hi Folks:

I've been licenced for 23 years, currently VE7ZD, and am in graduate school up here near Vancouver, BC.

I'm researching amateur radio and its history. I'm specifically interested in inventions, discoveries, or techniques that were developed within amateur radio and later spread to the electronics industry. Similarly, some of our operating techniques and procedures were later widely adopted by other services.

Hams operate outside of the structured environments within industry, and I think that this freedom has permitted us to invent and discover without being shackled by any policy issues, or possible stigmatism from investigating things that would be considered "too far out in left field" by management and non-ham co-workers.

Examples would be the investigation of wavelengths below 200 meters, with the discovery by hams that such wavelengths were better for propagation than longer waves; packet radio; APRS; propagation studies that were undertaken in the 20s and 30s; facsimile; SSTV; and network operating techniques.

Some of this stuff was regulated, such as the banishment of amateur radio to the "useless" wavelengths < 200 M, but this sort of proves my point. There's been lots of innovation within the hobby, and the general public now benefits from it.

If anyone could provide me with more examples, or good books or articles on this topic, then that'd be great. Of course I'll give appropriate credit to those who assist!

If you could email me as well as posting your reply, thanks. There's lots of traffic in these groups and I don't want to miss any replies.

73,

Kevin VE7ZD

How about if I start you off with a pointer to a piece by the guy who invented SSTV, Copthorne Macdonald, VY2CM, in his own words. SSTV was invented at the University of Kentucky, in Lexington, Kentucky.

http://www.ultranet.com/~sstv/history/

Dave

P.S. Standard Disclaimer: I work for them, but I don't speak for them.

Packet radio already existed. Somebody (I can't remember his position
or whether he was a ham) in what was then the Department
of Communications here in Canada, with a name like deMercado, had had
some experience with Aloha Net in Hawaii. He decided it was time
for hams to move forward, and so he changed the rules in Canada to
allow packet radio, and introduced the Digital License. That license
carried no code test, but what was said to be a more complicated
theory test, and was VHF only, maybe restricted to certain bands. I
thought there was also a segement or two set aside for packet that
only Digital License holders could use. I remember he came and talked
to one of the local clubs in 1977 or 78, so long ago that the details
are vague.

So it's debatable how much ham radio influenced packet radio. On
the other hand, I don't dismiss the value to some individuals, who
got it going in ham radio and played with it, and used that
experience in the commericial area.

I think the influence of ham radio on technology in recent years has diminished. That's less important than whether it is still affecting the young, getting them interested in electronics and radio at a young age and providing them with a place to play with these things.

But up till a certain point, ham radio was basically synonomous with electronics and or radio. You don't have to go any further than Howard Armstrong, who was a ham first and it could be said his work was nothing more than an extension of ham radio, even if it influenced radio tremendously; regeneration (and regenerative receivers) the superheterodyne receiver, the superregenerative receiver and practical FM. You can't do anything in radio without one or more of those things.

A lot of the oscillator circuits are named after people who happened to be hams.

I thought practical narrow band FM for two way communication came from a ham, something like the guy who started Sonar, but that is based on some remembrance.

Amateur satellites certainly must have helped the field. The first OSCAR went up only a few years after Sputnik and must have cost significantly less. The concept of a piggyback launch came from OSCAR, and certainly others have taken advantage of that. There have in recent years been "OSCAR-type" satellites, ie relativley simple and inexpensive, which have probably been mainly experimental but have either helped provide a training ground for satellite work or helped "third world countries" in some way.

And you can find examples of hams supplying practical experience (gained from the hobby) in some of the important projects of the last century. I can't get to it easily, but I read a book about Benchley Park during World War II where they worked on what the other side was doing, and the author mentions right at the end the importance of hams in the practical experience they brought to the process. I think there was a similar mention in a book about radar development during WWII. People would come out of the universites, and know all the theory, but be lost when it came to practical work, but hams had that down because of building their own equipment. And of course when WWII started up, hams ended up filling various technical roles in the armed services.

I thought the first person to play with radio astronomy was a ham. If it was't someone who followed up was.

The US Army tried moonbounce in the forties or fifties, but they needed big arrays and lots of power. Hams followed, using much simpler equipment. I'm not so certain moonbounce has much practical use for society other than hams, since others can put up satellites while hams are somewhat limited, but the process of advancing the art may be as important as whether the technology actually migrates elsewhere.

A lot of the history has been written. The ARRL had or has some books on the history, including that one about "200 meters and down...". "Empire of the Air" by Tom Lewis (and it was a Ken Burns PBS show some years back) dealt with Armstrong, Sarnoff and DeForest and probably is fairly available. There was a book about Armstrong, I can't find my copy right now, first published in the fifties and then in the sixties by Bantam Paperback, that I've found in used book stores that provides good, though not too technical, coverage of his life.

Since you can now get QST easily on CDROM, it would be worth getting the early years, actually get the whole set if you've got the money, and then you can see the history unfolding as it happened. The other ham magazines may not be as useful, since they came later, and more important they aren't as available so cheaply or conveniently.

Once you have the ham history, then you can start exploring where it fits into the rest of electronic/radio history. Whether it was simply implementing something discovered elsewhere, or had impact on society beyond ham radio.

And you might want to dig up an article by John W. Campbell (yes the legendary editor of Astounding/Analog SF magazine) who was a ham and once upon a time wrote some technical articles for CQ. He once wrote an article about "How to be an Amateur" pointing out some of the benefits hams have to innovate for the simple reason that they aren't bound by corporations. I think it was published in an early issue of 73, and then reprinted once or twice. 1971 comes to mind.

If you want to run a scanning mailbox then you'll need the PTC-II. If you're just going to do general purpose hamming then save some bucks and get the IIe. I believe the performance of the two are the same.

If you replaced your serial cable with one that has all 25 wires this will happen. The PK-232 should be run with the 9-wire cable. Just a thought.

Hi Bob,

It mainly depends on whether you want to set up your own BBS station (i.e. you are the BBS , not just a user). In that case I believe the most popular software (WinLink) requires a PTC-II to provide transceiver control (this might have changed in the latest version, WinLink 2000).

If you are not planning on setting up a BBS station and do not need dual-port capability, then the II will not buy you much vs. the IIe. Even if you want automatic transceiver control, you can have this with the IIe because a good deal of software provides transceiver control on second serial port (assuming your PC has two serial ports). For instance, I use Airmail 2000 for email and XPWin for general use, and both fully support transceiver control via a second serial port. The IIe is smaller and uses a little less power, if that matters.

Both the II and the IIe use the same DSP, etc., and have identical performance on the air. It just depends on whether you need dual-port operation and/or transceiver control via a single serial port on your PC.

I should note that the PTC-II supports TTL output to the radio so if you are using Icom equipment, for instance, you will not need the usual TTL to RS-232 adapter. In some cases by the time you buy an adapter for the radio and a second serial port for your PC (if not already equipped) you may have come close to the price of the PTC-II anyway. But of course if you buy the PTC-IIe and the extra hardware then you can use the extra hardware (additional serial port, etc.,) for other purposes as well... just depends on what you have in mind...

Hoped I have helped and not confused. More info at www.scs-ptc.com, but I guess that you know that.

1968. Help with MFJ-1278 and Kenwood TMV7

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-13 00:00:00 UTC
From: Pedro Braz <pqp@netcabo.pt>
Message-ID: <8fjfpejfu5@duke.telepac.pt>
Source record: 12948

Hello,

I have a MFJ-1278 and a Kenwood TM-V7 and need to connect them both.

The MFJ 1278 Pin out is as follows:

PIN 1 - MIC. AUDIO
PIN 2 - GND
PIN 3 - PTT
PIN 4 - REC. AUDIO
PIN 5 - SQUELCH INPUT

The TMV7 Pin out is as follows:

PIN 1 - Packet data input(PKD) (TX data from TNC to transceiver)
PIN 2 - GND for PKD
PIN 3 - Packet Standy - TNC can use this pin to inhibt the transceiver
microphone input while txing packet signals
PIN 4 - OUput of detected 9600 bps date 500mVp-p 10Kohm
PIN 5 - Same but for 1200bps (500mVp-p 10Kohm)
PIN 6 - Squelch Control output (Inhibts TNC data txing while transceiver
squelch is open, Prevents interference to voice comms over the same freq.
Output leve: Open Squelch +5 V high Close Squelch 0V Low.

They say the 9600 pin should be used when there is only one PIN coming out
of the TNC for the data.

The idea I have of connecting them is:

MFJ TMV7
PIN 1 ---- PIN 1
PIN 2 ---- PIN 2
PIN 3 ---- PIN 3
PIN 4 ---- PIN 4
PIN 5 ---- PIN 6

IS ot ok? Should I do it another way???

I really need help.

73's and thx all

CRO, or Classic Radio Online has changed names, sort of.
We are now known as CRO Wolfpack. Wolfpack being a collection of people interested in OTR Programing. Thus we are the pack, or hunters of TV.
Because of this, we have changed our OTR website TOTALLY. I hope you'll come and look at the new look, it is something wonderful! At least I think so. We still have the OTR station, 24/7 OTR shows with NO REPEATS, as well as online shows for you to listen too, however we also have the new look.
Enjoy!

The first amateur was Marconi in the history books but you
might want to check out Braun, Tesla, and a few others.

"Marconi shared his Nobel prize with German physicist Karl Ferdinand Braun, b. June 6,
1850, d.Apr. 20, 1918, in 1909 Nobel Prize for physics with
Guglielmo Marconi for his work in developing the radio.

Braun, who spent his career as a professor of physics at
German universities, increased the range of Marconi's
transmitter, invented the crystal rectifier (a device that
allows current to flow in only one direction, and improves
radio transmission), and later invented the oscilloscope, a
cathode-ray-tube laboratory device that was the forerunner of
today's television and radar tubes."

Source: The New Grolier Multimedia Encyclopedia

Another great innovation that hams brought to the party
was helping people in times of distress - for FREE! Ironic
that a group of people known for "intense thrift" would give away
life saving services at their own costs - sometimes putting their
own lives at great risk too - and expect nothing in return!

Good luck with your thesis - please post it when done so we
can all enjoy it.

I would have thought that the start of Radio Astronomy came when Jansky
was working at Bell Laboratories from 1931(?) to 1935(?). To be fair,
Reber worked at home a couple of years after that and did a lot of good
work. Anyone know if Reber was a licenced Amateur or just a very good
SWL? ;-)

> 2) micro satellites

Probably one of the most significant examples (in my view anyway).

Mark.

Kevin:

More Re: Marconi the amateur.

I have in front of me here a hard cover book "The wireless experimenter's manual", by Elmer E. Bucher, Wireless Press, Inc. 1920, LCCN 20-5750, LC Call Number TK9946.B85. In the back of the book is a tear out page which is an application form to join "The National Amateur Wireless Association", the fee for joining is $2.50. The address for the Association is given as 326 Broadway, Room 301, New York.

The head of this Amateur Association is listed as: Gugliemo Marconi, President
There is a National Advisory Board of Vice Presidents listed, which includes: Prof. Arthur E. Kennely, Harvard, Prof. Alfred N. Goldsmith, College of the City of New York, etc...

The text on the application reads... "Join Now" You should be a member of the organization that is doing real things for the advancement of amateur radio. etc.... I could make a xerox copy of the application form and fax it to you if you wish.

In recent years we have such "amateurs" as...

Phil Karn KA9Q...

who almost single handedly introduced the Internet's TCP/IP protocol suite to the modern personal computer [IBM clones as opposed to the Unix based computers] by the release of his "KA9Q" TCP/IP "stack" as free ware. Many professional programmers had said that the base PC with the 8086 microcomputer and 640 K of memory could never support such a complicated communications stack and that only powerful Unix machines could do that! Well... Phil did it anyway and then...

This KA9Q "stack" was picked up and modified by many commercial interests and led to the exponential growth of TCP/IP on the PC platform, and made a very large contribution to the commercial growth of the Internet.

>The first amateur was Marconi

I'd think he fall into the "professional" catagory rather than
the "amateur" catagory. He had visions of $$$ in mind all the
while he was perfecting his apparatus. Note that his equipment
contained nothing original -- he utilized ideas and devices of
the legions of inventors who came before him. (For example, in
Blake's HISTORY OF RADIO TELEGRAPHY AND TELEPHONY, an encyclopeadia
of early wireless circuits, Marconi's apparatus isn't presented
until page 100 -- 99 pages of circuits and their descriptions
come before him.) We can thank him for putting all the pieces
together into a workable system.

Yes, an *excellent* URL, thanks!

> You will see packet programs, terminal programs etc for Linux.

I confess my ignorance - but all the terminal programs
I've found there were for packet, not RTTY nor PacTOR.

Should they work [for PacTOR and RTTY]?

> For the link to the RTTY, PACTOR program for Linux by HB9JNX
> see
>
http://radio.linux.org.au/pkgdetail.phtml?sectpat=All&ordpat=title&descpat=pactor&pkgid=65

This link (alas!) doesn't work. The server claims error in
MySQL query or such...

I've succeeded getting to "Hf" program on this site, which uses
PC soundcard and supports RTTY, Amtor (Sitor), Pactor 1.

The URL I used is:

<http://radio.linux.org.au/?sectpat=All&ordpat=title&descpat=pactor>

Now, could somebody please tell me if a program similar to
KamPlus on Linux is available to drive PK-232MBX/DSP, DXP38
and/or PTC-IIe? I.e. to control an MCP form Linux? [If it
got a nice GUI, so much the better, but beggars can't be
choosers :-]

Thanks!

Source record: 12871

Hi,

I've finally dusted my old PK-232MBX, but couldn't send
a single message out (I tried RTTY last night :-). While
it copied with its usual agility (means - no more than its
normal share of garbled text on the screen :-), wwhenever I
pressed transmit, the rig got locked in transmit and the only
way to bring it out and into receive mode again ws to cut
the RF power on the tcvr from about 30W to about 5 (lowest
possible).

I suspect that RF somehow gets fed back to [audio-freq] control
lines - but does anybody have any suggestion wrt. (a) how to
determine where the thing gets in, and (b) how to get rid
of its unwanted presence in that unwanted spot?

I use PK-232MBX with unreparkable 12V power supply from Radio
Shack (cheapo), FT-990 (with built-in AC power), normal
home-made cable between 5-pin DIN on the rig and PK-232,
standard serial cable between PK-232 and a laptop (PII-400).

?????

Thanks!

I had similar problems and they all when away when I wound
all cables around Amidon FT-150A-F ferrite toroids.

I'm extremely glad you got rid of these problems!

Could you please tell me more about these toroids? Namely:
size/diameter and place(s) to acquire them?

Also, did you use them on *all* the cables? Because I have:

1. Standard serial cable between PC and TNC (would be hard to
wind this one around a "donut", unless it's of sufficiently
large diameter). I'd say a toroid of 2-3 inches inner
diameter would be necessary for it.

2. Two cables (RTTY/FSK and PACKET/AFSK) between the rig and
the TNC. 2/3 inch to 1 inch toroid should do (I think?).

3. Bencher paddles. Thin cable between the paddles and the rig.

4. Coiled cable between the [standard Yeasu hand-held] mike
and the rig.

5. The rig power cable.

6. The TNC power cable (between the power supply and TNC).

7. Power supply's power cable.

8. Finally - laptop's power cord.

Did you have to (and do I have to) "toro-ize" all the eight?

[I didn't mention the cheap RG-59 connecting cheap MFJ portable
whip antenna to the rig :-]

Thanks!!

The 150 in the part number indicates that the diameter is 1.5".

Amidon web page http://www.bytemark.com/amidon/

Fair-Rite web page: http://www.fair-rite.com/

> Also, did you use them on *all* the cables?

All of the PK232MBX cables except the RS232 cable to the
computer which came with a ferrite choke already on it.

I have a PTC-II and it is wonderful. However, I would buy the IIe if I were buying today. It has what you need, and dispenses with mainly features that most will not need. The transceiver control is not important to me.

The IIe is fabulous. Go for it.

Hi gang,

About 4 days left on my auction of this machine. It's only a 286 but, it will run on 12 volts (comes with homebrew cord). It has the AC adapter and an external 3.5 inch floppy drive along with an external nicad pack (which needs rebuilding). It's light and small (only 1.5 inches high, closed) so it's great for mobile operation. It comes with DOS 4.01 preinstalled (in ROM) but I have run it with 6.22 with satisfaction. Current bid is at $9.99 and you can see it at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=330799362

C'mon guys, at THAT price, I should give it to my kids (But they already have enough toys.). Thanks for looking.

Radio Randy

Hello ALL;

I am unhappy with this 'Pactor' proprietary business 'Ham' radio protocol.

I only recently, Feb 1999, purchased a Pactor - 1 TNC, new from Dentronics,
made by PacComm, that is, apparently, now OBSOLETE!

Even the new Ham Radio Guru's are NOT supporting PTC-1 Protocol.

I see that the program 'Airmail' is available - and is now needed to
communicate to the various new Popular Winlink HF stations.

2 things - Airmail is now going to be the ONLY acceptable link to WinLink
stations - even though Airmail does NOT support Macintosh nor PTC-1., and
the simple keyboard only mobile stations will be excluded.

I object!

The idea that sailors, RVers, campers, etc, would have access to the WWW,
and E-mail was great!
To now tighten up the strings to make them use certain, costly, types of
equipment, is BAD!

Personally, I would like to see some development into CW(or PSK31) to
Internet E-Mail systems developed! This business of having to buy a $600+ to
access the E-mail network is a step back! There are now MANY kits for Hams
for CW that should allow us to MIX the technologies - bring International
(Morse) Code to input into the new Internet World Wide Web and E-Mail.

Why not?

Two places to look for sure: http://www.packetradio.com

And on my web site (URL below) follow the link to 'My Shack' and then to the section on the V7A. There's a link that shows exactly how to connect the V7A to a KPC3+ (and yes, I got it from the Packetradio site). What that'll do is help 'translate' what Kenwood is calling their pins into terms the rest of us are more familiar with. That should get you going fine.

1994. PC PakRatt for Windows 2.0 - 2.1?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-15 00:00:00 UTC
From: "Casey (KC)" <casey@techie.com>
Message-ID: <ILOT4.527$eAM1.8847436@tomcat.sk.sympatico.ca>
Source record: 12880

I have the PC PakRatt for Windows Ver. 2.0 software (with my call written to the disks), from when I owned a PK-232MBX which I sold and later regretted the decision. :-) . I recently bought a PK-232 which turned out to be an older version, no pactor or mailbox (the joys of auctions).. It's upgrade time for sure, even PC PakRatt for Windows won't work with the old EPROMs.

I see that there is a PC PakRatt for Windows ver 2.1 upgrade. I read about it on the Timewave web site but other than the claimed Y2K fix I can't see that it offers anything new. I say claimed as we have seen a lot of hype over the Y2K thing..

Can anyone fill me in on the Y2K problem with this software and any other changes or improvement that might be gained by upgrading. I ran PC PakRatt for Windows 2.0 on a Win98 system with no problems.

Thanks...

Ken - VE5KC

1995. Re: PTC-II and IIe data controllers

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-15 00:00:00 UTC
From: Bob Lewis <aa4pb@erols.com>
Message-ID: <8fopa9$qj8$1@bob.news.rcn.net>
Source record: 12881

It is not the PTC-I that is obsolete. All PTC-IIs will link with any controller that properly implements the PTC-I protocol unless the user has configured it to require Pactor-II. There may be software out there that won't interface to the standard PTC-I to computer protocol but that's not really related to the Pactor protocol. I haven't used any MBOs in a while but I'm surprised that they *require* you to link in Pactor-II.

The reason that Pactor is preferred for mailbox operations is because it is an "error free" protocol. If you were to use PSK31 or CW then your uploaded message could be full of errors.

Hi Randy,

You might consider keeping your 286 for its eventual antique value. $9.99 is already more than its current useful value. ;-)

Probably because Morse is 'way too slow, and is wildly inferior to
Pactor, especially if automated.

Too bad about your TNC -- I guess the company didn't make it in the
business. This happens, of course.

Pactor is still the way to go.

Why do you think PACTOR I is obsolete? PACTOR II is an improvement
but it is compatible with PACTOR I and doesn't obsolete it. Did
higher speed modems obsolete the 28.8 version? Nope, I still use
a 28.8.

I've got a 386 DX-25 notebook but the backlight is toast. Thats about the
only thing that these machines get trashed for ... (backlight unavailable)
.. I'm trying to implement an LED backlight using $20 worth of yellow
LEDs, running off the original +5V supply. (who needs a brightness control
anyway ...)

Worth fixing , a bit slow but useful as a backup machine ...

Andre

I guess that I wasn't very clear in my 'complaint'. I'm sorry to be confusing.

My complaint is that the older PTC-1 protocol command set isn't being supported in the new 'Airmail' programs yet.
And the newer MBO's WILL be requiring that connections to them be established only through the 'Airmail' program.
Direct keyboard to MBO connections will not be supported.

Therefore, unless the 'Airmail' Program is retrofitted with the old PTC-1 Command Capability, my UNIT will become unuseable for that purpose, technically OBSOLETE for me, since most of my useage has been with the Winlink MBOs.

I agree that Pactor-1 will probably be around for a while, since the PTC-11 systems are still pricey. However, without Airmail, the connections to WinLink MBOs may become more diffcult to find.

So Pactor-1 is not the problem, only the available support for the newer Software Programs to integrate the older to the newer is!

I have contacted the Airmail Support Group, and while they would look into the possibility of a retrofit, they seemed to think that there wasn't much demand for the PTC-1, and my PacComm system. I did not ask about software for my Mac Laptop, nor did I ask about Linux compatability.

After all, most of these developments are being done FREE!

My biggest complaint is with myself, for not researching the Pactor Scene enough to realize that the $265 box I bought was an orphan that was already 6 years old. And was not on the list of supported TNCs.

I kick myself!

That might be stretching it. I think MIT's PCIP predated the KA9Q software,
and probably had a larger base of commercial derivatives before CPU speeds
outgrew them.

But look at RFC 1122 for references to the "Karn algorithm" for computing
more accurate round trip time estimates for TCP. I think there is an
ACM SIGCOMM paper referred to in there. I'm pretty sure this came out of
the work with amateur radio TCP/IP (a lot of the really good, fundamental
insights into TCP protocol dynamics in the 1980's came from the experience
of running TCP over the really crappy networks that existed then).

To anyone who's ever communicated with the skies via Ham Radio,

We are an Internet TV channel called spacewatch.com, and are currently in the process of making a show about how astronauts often communicate with others via Ham Radio. If there is anyone out there who has any experience with this, or knows anything about it, and would be available for interview, please e-mail me at ciara@spacewatch.com. I would be delighted to talk to anyone with any knowledge of this topic. At the moment the show is merely in the research stages, so any information at all would be appreciated.

Yours,
Ciara.

I think that Mike may be referring to the fact that AirMail 2000 (and WinLink 2000 I believe) only support binary file transfers, including email messages. Pactor I _is_ still supported by all WinLink stations and software, but only if the particular TNC supports a proper host mode and binary transfers. There are some Pactor I TNC's that are supported, such as Kantronics and AEA units.

The reason for the strong preference for Pactor II by BBS operators is that Pactor II is _so_ much more efficient in terms of throughput and weak signal stability that it will allow them to support many more users. A Pactor I connection probably has a 4:1 additional connect time ratio over Pactor II, and just forget about any file downloads with Pactor I. Pactor I is OK for a few messages on a occasional basis, but if you really need HF email capability then Pactor is simply the only way to go, proprietary or not.

>Pactor [II] is simply the only way to go, proprietary or not.

Could someone post a link to the Pactor II protocol description?
(One that is accurate and complete enough to write a conforming
implementation.)

Last I read Hams aren't allowed to use secret codes.

It would be nice if everything could always be backward compatible but you often have to give up a lot to do that. I worked for an outfit that insisted on backward compatibility and they ended up 10 or more years behind the times and they're still having a difficult time catching up.

The PC itself is a prime example. The BIOS, the buss, and the interrupt system should have been scrapped 10 years ago - but alas we had to maintain backward compatibility so today we deal with a cludge of hardware patchwork.

I don't know much about AirMail but my guess would be that they're taking advantage of the PTC-II's host mode to avoid problems with 8-bit binary data. By definition, that makes it incompatible with the PTC-I serial interface.

2007. Re: PC PakRatt for Windows 2.0 - 2.1?

Source record: 12893

Hi Ken,

Yes, the upgrade price from PakRatt 2.0/2.1 or Logwindows 3.05 or before to the Digital trio is $89.95. This includes PKterm 1.4d, Logwindows 3.07 and Wefax '99. The total price if all were bought separately is $209.95 (LogWindows 3.07's new price is $69.95), so you're saving more than 58% with the upgrade price.

While Pkterm '99 will work with the 1988 Eproms, it wont work as well as with Firmware that is dated 12/93 or later. it's really worth the price to upgrade the firmware, as well as get the DSP option.If you're coming to Dayton, come by booth 112 and we'll be there (Timewave is right next to us again this year, booth 111).

We'll also be showing HalTerm for the HAL DXP-38 and the PTC-Term for the PTC-II and IIe. Both development versions will be in demo at the booth as well as Pacterm '98, MultiComm Host (still wating for MFJ to sign the OEM agreement so we can start selling it) and other products.

And this year we'll even have a demo machine with lots of software loaded, so everyone can sit and play with it.

Some info on http://www.scs-ptc.com and http://www.pactor.com
Last week I turned up some good info by doing a web search
for "PACTOR II" but I didn't bookmark the sites.

Thanks for the input, John..

Looks like my problem at this point is even worse as PC PakRatt for Windows Ver. 2.0 won't work with this old PK-232. On the Timewave web site, it says that August 1991 firmware is required. That must be the problem as this TNC shows a date of Dec. 1988 on boot up.

I've had it working FB with Xpcom, both Win & DOS and Winpack. I plan to give PK TERM 99 a try as there is an upgrade path available. I see that Creative Services Software also has a Digital Trio which includes PKTerm 99,Wefax 99 and LogWindows. Since I have PC PakRatt Windows Ver. 2.0 and LogWindows 3.0, maybe there is a good upgrade price.

The first project I want to look at is upgrading the PK-232.. To DSP or not to DSP that is the first decision as I have a TW DSP9+ which works very well for me. I've never really had need of the mailbox but looks like it is part of the package. If the upgrade only supported PSK, it would make the decision even easier.. :-)

Hmm, I have a silly question. How can they possibly
enforce this requirement? I.e. how can somebody on
the other end of the wire (err - wireless :) know
what code is driving my hardware...?

Also, why do they [MBO's] care?

I disagree. Pactor 2 has been out for a long time. It is far superior to Pactor 1, but Pactor 1 is still, and will remain, very popular for keyboard-to-keyboard qsos. I don't think we need to anticipate a Pactor 3 any time soon.

Yes, it is proprietary, but would you rather it didn't exist at all? That is probably where we would be if there were no financial incentive for its creators. It seems to me that amateur radio is enriched by having Pactor 2 as a choice -- it is a very powerful mode that enables even pretty modest stations (like mine) to communicate reliably over very long distances. This is an interesting question which I asked some time ago. In my
opinion it has to be documented.
It even is not documented as well as eg. Clover, where you get some
information (not enough to reimplement it
though).

I only see 3 possible reasons why they did not document it:

- they are too lazy... this is usually my reason for not writing
documentation... ;-)

- Pactor II has some serious design flaws (like using non-coherent
DPSK, lack of channel equalization and using Pactor-I for link-setup is
not a good idea at all)

- they want to use it commercially (test it in Ham radio then sell it to
someone. Of course they don't like the idea that everyone could cope
their design and earn money with it aw with Pactor-I. But we all know
that the PTC-I and II were *much* better at Pactor-I than the "clones"
like KAM or PK232... And Pactor-II is very demanding in terms of
processor power (design flaw?) and would not run on any of these
devices...)

I think it could be a mixture of the last two...

Remember, it is AMATEUR radio. "if there were no financial incentive for
its creators" should be no motive, the amateur radio hobby is centered
around doing radio without financial incentive.

So YES, probably when it is proprietary it better not exist at all.
That would motivate hobbyists to create it (when there is a need to).

So by this logic there should be no Kenwood, Yaesu, or Icom. That would certainly motivate the few hams left to create their own rigs. We've had proprietary stuff and people making money in ham radio for years (Collins, etc).

So here's our minimum requirments for a new data mode:

1) Extremly fast
2) Extremly robust
3) Doesn't require any processing power (i.e. runs on a C64)
4) Is given away free or is sufficiently documented so that it can be easily stolen.
5) Is always backwards compatible with all our outdated stuff

Good luck.

As I remember Phil Karn introduced TCP/IP for amateur radio at one of
long gone Mid-Atlantic Packet Radio Council meetings.... (the one held
in Savage, MD). I can't put a year on it. But at the time the TNC-2 was
rumored but not yet a reality.

It was an amateur radio adaptation of the existing TCP/IP. Just as AX.25
was
an amateur radio utilization of the existing X.25 transfer protocol.

However, I think Phil did a lot of development for TCP/IP in his job
(memory wants to say that he worked for Bell but I may be wrong)

If I root around in the attic I might be able to find the diskette
he gave out that day.

But going on from here....
While packet radio was what we could call a "reverse" development in
amateur radio, meaning something we adapted, it sure did open the door
for commercial development of mobile data services.

They can't - but they can and do require you to use the proper protocol.
Airmail is probably the only compliant software available. If you were to
write your own software that worked over the air in the same manner as
Airmail, it would work just fine.

I've been around for a while, but have underutilized my licence. I have an old Atari Portfolio around, as well as serial and parallel connectors for it, and was wondering about hooking it up to my th-28a. I realize I need a TNC modem and wiring for the connection (though not how to do so), but I was also wondering about whether there was some Portfolio-specific packet terminal software (given the non-standard serial address of the pofo). Can anyone help me out, here, or point me in the right direction? Thanks...

Team,

I have one...works as advertised....some minor problems, such as always must have power on to use the mike normally...and a short rigBlaster to Mike cord..

Built very, very well...cosmetically and electronically...

Works beautifully...maybe version 2 will have a bypass position...and a reasonable length cord.

Worth the money...

Go for it!...

Hey Guys,

What I am saying is that Next Year the PTC-III will be out, and only 'some'
of your equipment will be retrofitted,
for Software.

Bill Gates showed that most of us are Totally Dependent on HIS Software!

Unix, OS2, Linux, Mac OS, not withstanding, at 20% of the overall market, we
ALL will be suffering if a lot of proprietary Software, Hardware, becomes
the standard for Ham Radio Operators!

Obviously, from my E-mail, this doesn't bother a lot of Hams!

Many have the attitude - So go and buy something else!

Right on!

I will!

Hello Ken, The Y2K problem in Ratt was real. Instead of loading the TNC with
the correct date it flashed an "Illegal" command screen and skipped the load.
The rest of the upgrades to RATT were for other units (like the DSP-232 and
the DRAKE TNC's.) This software is just about at the end of it's useful life
as we already see signs of MICROSOFT dropping 16-bit support.

You can try the 32-bit replacement for RATT, PK TERM 99 (WIN95/98 and later)
by downloading the demo version from <http://www.timewave.com>

That makes sense -- applying your logic, we should forget about Yaesu, Kenwood, Icom, Ten-Tech, Drake, and other commercial ham radios. There was a financial incentive for them, they charge money for them, and without them, there would be an incentive whereby hobbyists would create them (when there is a need to).

Guess I don't agree with your logic but hey, takes all kinds. I LOVE Pactor 2, and there is no other mode that comes close. I don't mind paying 50 bucks or so over the entirety of my ham career to be able to use the mode (that's about what it costs, I think). Compare that to how much you have shelled out to Yaesu, Kenwood, Icom and/or Ten Tech. I think you get my point.

2029. Need help with SV2AGW dialup TCPIP

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-17 00:00:00 UTC
From: pdickson@worldnet.att.net
Message-ID: <170520000920193988%pdickson@worldnet.att.net>
Source record: 12765

I am trying to get the SV2AGW TCP/IP software working with no luck. Any suggestions? Here is what I have done so far - this is on a laptop running Win95. Win98 is not an option due to memory requirements.

- Installed WINSOCK v2
- Installed Dialup Networking
- Installed AGW virtual modem driver
- Configured AGE packet engine for dial-up mode, set my call and 44. IP address in the place provided, and the IP+call of the gateway node in the blanks marked "server".
- Created DialUp Networking icon to create the "connection" between WINSOCK and the AGW engine. Set my 44. IP address there.

The plain packet mode stuff works just fine. The AGWMONITOR and AGWTERM programs work as expected, and I can connect to the gateway system that way. But any attempts to use TCPIP just time out.

Pings to my own address work fine. Pings to the address of the gateway time out. The MONITOR window shows no packets going out, and my radio never transmits.

Would like to get this working with Eudora so I can use POP to fetch my mail from a node on an ethernet just behind the gateway machine. This whole path works fine with JNOS, but I would rather use Eudora than the relatively lame mailers that work with JNOS.

Huh, did you install agwtcpip.inf and agwtcpip.sys? These are in
the tcpip.zip file. I haven't set this up recently, so my memory
isn't clear on this, but I do remember needing these files.
(And, if it makes you feel any better, that the
setup of this is a little funky, and crashed the first time and then
worked the second time, or something like that.) But, I did
get it to work.

None of that equipment is proprietary in the sense that it will only work
with another radio from the same company. You aren't in a captive
market. With PACTOR II you are.

2034. non-format webradio euphonic

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-17 00:00:00 UTC
From: euphonic@mediawar.com
Message-ID: <3922fa26.25968904@news.xs4all.nl>
Source record: 12770

http://www.euphonicradio.com
(please forward to those interested)

*A new radiostation without boundaries is born. Dj Hector Heclectic (Gideon Hofland) presents in cooperation with mediawar.com and Tree-Top.com webradio by the name Euphonic. A non-format station with an hour of radio every week in the do-it-yourself tradition. Fresh and settled music, interviews, sound journeys, poetry and other human outings. Hopefully with help of the listeners, who are asked to send their demo's of yet to be discovered bands, MP3's of homemade work,
poems and sketches.

http://www.euphonicradio.com
(please forward to those interested)

*Every programme of Euphonic is different. A musical mix by a dj, the next time interviews only and a combination the following week.We have thought of the international character of the internet
also. Depending on the language of the items and the music, the presentationis in English or Dutch. When it's the newest music or a mix then it's all English.With Dutch cabaret, interviews or satire, all will be in Dutch. The text next to programme explains the content and the language used in that hour of Euphonic radio. Coming specials are about sounds and music of South Africa and Three Days of Dutch Dance, a musicfestival in Amersfoort (the Netherlands).

*With thanx to internetlabel http://www.tree-top.com , for custom made
CD's with good music.
And http://www.mediawar.com ; design, music and cartoons
Thank you for your attention!

2035. N and eed Info on UHF Motorola

Looking for someone that can help me identifi which motorola radio I have and also need a service manual for it. This radio is approx. 12 inches square and is mounted in what looks like a base station cabenet, which contains the dc supply, meter for monitoring the different stages of the rec. & xmitter. The rear of the cabinet has a terminal strip which has the mic and ptt leads on it. This is all solid state UHF and looks like abt a 45 watt pa board. I would like to move this down in the amateur portion of the band. The cabinet itself is approx 24 inches square by 8 inches tall. It looks like it was used as a desk top model. Tnx for reading my post.

Ditto CLOVER ...

Maybe someone should place a nice error correcting protocol atop
PSK31 (and it's obvious wider bandwidth/faster data rate mods).

I love Pactor and am planning to buy PTC-IIe. However
I'm also interested in the legal issues of Pactor-II
protocol - i.e. is the protocol itself "secret" or
not?

My personal suspicion is that it's not secret but _patented_,
so nobody can implement it without paying whatever royalties
PTC chooses to charge.

I'd like to hear from those who know more, please. Anybody?

Actually not concerned about the screen size, but the receive buffer on the
palm pocket aprs software gets overwhelmed, and loses data and sends a
receive buffer overflow error.
and to see received packets I sometimes have to keep switching from the"
terminal window", to the" packets received window" to get all my incoming
packets.
plus sometimes the packets just disappear and I lose half or more of them.
I will try the telnet program , but have you had problems with disappearing
received packets.

This is a total non-issue, there is nothing illegal about a 'proprietary' protocol, only transmissions whose meaning is intentionally concealed by encryption, etc. Anyone equipped with a Pactor II-capable TNC can receive your transmissions, including the FCC. You are transmitting entirely in the clear.

You will greatly enjoy your PTC-IIe.

That wasn't the question, Seth. The question was - can an individual
ham implement PACTOR II on a PC/soundcard for his personal use without
getting into patent/copyright trouble?

I have a problem, that I hope some-one can help me with

My monitor is putting out a reasonably strong signal on 14.080 (or there-abouts) and then additional signals every 23.5khz either side of that.

Ideas on reducing these signals please. I have a ferrite in the power lead to the monitor, which has reduced the level slightly, but short of switching the monitor off, (which does make RTTY, PSK31 a bit difficult) I am running out of ideas.
The computer is an HP vectra, with quite good shielding and does not appear to be a problem.

Thanks

Some years ago I heard some rumors that there were negotiations between SCS and at least one U.S.-based TNC manufacturer. The same rumors said that the gap between the two opinions on the royalty per TNC were too far apart to come to an agreement.
Guess it took SCS several man-years to develop PACTOR-II, so it's only natural they are trying to recuperate their costs.

I would not say "extremly" fast, but 2400 bit/s should be the minimum
possible on an SSB channel, 9k6 may even be feasable.

> 2) Extremly robust

This is very important on an HF channel.

> 3) Doesn't require any processing power (i.e. runs on a C64)

Not the C64, but should run on a decent pentium class PC.

> 4) Is given away free or is sufficiently documented so that it can be
> easily stolen.

A GPL'd open source project would be fine, yes...

What do you steal if you reimplement a data mode? Look at all the
commercial military data modes. All of them
are thourougly documented so that you could implement them if you want.

> 5) Is always backwards compatible with all our outdated stuff

If it is really so much better, than no, it does not have to be backward
compatible.

I think this discussion in about "is it possible to earn money with
amateur radio modulation schemes". And may idea of this is NO, the basic
data modes have to be open - like every mode BEFORE Pactor II ...

Remember this is AMATEUR radio, and we do EXPERIMENTS.

PSK31 was made for human to human communication. This is the main
difference if you compare it to Pactor-II or Clover. If you want faster
and more reliable data transfer we should think of something different.

What kind of "something different"?

Change the resolution and/or the refresh rate, and everything will move.
Hopefully out of the band you are interested in.

2048. Radio Am Bulletins in Real Audio

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-18 00:00:00 UTC
From: Jeremy Boot <asperges@innotts.co.uk>
Message-ID: <1878iskfo20vn16lkaak3rpa5d6md9op4a@4ax.com>
Source record: 12784
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.antenna,rec.radio.amateur.dx

The GB2RS news bulletin for 21st May 2000 is read to you in Real Audio
at:

http://listen.to/gb2rs

There are links to relevant sites as well as to other countries' ham
radio news services.

This edition of GB2RS is also transmitted in the Nottingham area on
Sundays at 10.30am and Mondays at 10.30pm by G7WFM on 431.075MHz as
well as simultaneously at those times over Internet.

The Effect of the RealAudio Bulletins
~~~~~~~~~~~~~~~~~~~~~~~~~~

Although the idea was to provide fellow amateurs with a convenient new
service, there have been some surprising extra spin offs:

* The bulletins are now heard much more widely than
before
* You can hear them at any time
* They are useful to those with visual impairment
* They are carried world wide by other Radio Amateur News
Services
* They are heard "live" on Sundays and Mondays on
Internet Gateways

In addition, excerpts of the News are now carried many weeks by US,
Canada, Australia and South Africa Amateur Radio Society news services
and also by some DX news programmes such as those on HCJB in Ecuador!

The Bulletins are updated weekly.

It was a hypothetical question just to convey the concept.
But I think maybe one of the 600MHz PCs should be able to
handle it after a few man-years of programming effort.

Yes, even if SCS didn't mind a strictly non-commercial PC version floating around I believe development of such a product would be a daunting task. I remember reading somewhere in an article on this very subject that an OS such as Windows wouldn't be suitable in any event, since timing is so critical and Windows does not allow enough application control over CPU time slices for applications such as this. Linux, or DOS, maybe, with a very fast processor and much better DSP than available on a cheapo sound card.

A valid and interesting question, but on second thought... maybe I'll just buy a TNC...

So, 'experiment' and develop a product that meets you specifications. In the meantime I see no reason that a manufacturer shouldn't be able to develop a product on their own and be compensated for their time, you are not required to buy it if you don't want to. A philosophical mandate for all such protocols to be completely in the public domain is rather limiting. The marketplace will determine whether the product succeeds or not. If you want you can always invest thousands of man hours to develop a superior protocol on your own, give it away for free, and put SCS out of business...

2054. Live voice & text chat for hams

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-19 00:00:00 UTC
From: MITBR <mitbr@earthlink.net>
Message-ID: <Vx%U4.2631$S31.44623@newsread2.prod.itd.earthlink.net>
Source record: 12790
Cross-posted to: nl.radio.amateur,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.space,rec.radio.shortwave,tw.bbs.rec.radio.amateur

Hello folks!!
Just wanted to let everyone know that there has been major improvements to
the world wide voice & Text chat system for hams!! There is now the
provision for private chat rooms. The idea is that you wait for someone to
arrive in the main chat then go to a private chat with them if you wish. The
audio in the system rivals that of anything currently available and also
supports a text chat on the same screen. Use the system to set up skeds,
check the muf on a freq, meet new hams, have meetings or just plain ragchew.
Go to the url here to directly enter the chat
http://home.earthlink.net/~mitbr/AmateurRadioChat.htm
If no ones there when you arrive simply hang around for awhile while you
surf the net some one will come along!! Spread the word folks .

If really should not be a big problem in Linux as there are Pactor-I and
Amtor implementations
available and the timing is *very* strict in Amtor.

The CPU used on modern PCs is a lot faster than out-of-the-shelf DSPs.
And the DSP and
CPU used in the PTC-II is not state of the art anymore...
The main problem in demodulating Pactor-II seems to be the FEC. As they
claim to use a
R=1/2 constraint length 9 convolutional code we have 256 states in the
viterbi...

The next thing that is very time consuming (and at the limit of the
current PTC-II) is
the link setup using Pactor-I. DL6MAA told me that they are running
their memory ARQ
all of the time and for several possible time and frequency offsets.
This way they
are able to establish a link with very bad S/N. The main problem with
Pactor-II is this
link setup as you need a lot less S/N for Pactor-II than for Pactor-I.
So you could
connect using your 1kW PA and then turn it off once the modems have
switched to Pactor-II...

>
> What kind of "something different"?

BPSK and QPSK as used in PSK31 is a good starting point, but you can't
just go and make it faster, because
you have multipath propagation on the HF channel. So we have three
options:

- use several carriers and modulate them slowly (this is what Clover and
Pactor II do, OFDM is another popular approach)
- use one carrier and try to equalize the channel (this is what the
"commercial" modems usually do)
- ignore it (this is what GTOR does, it works if the FEC is good enough
and the multipath is not so strong...)

Next point is we need strong FEC (maybe together with a good Hybrid ARQ
scheme) and interleaving of the data - PSK31 can't do long interleaving
because you don't want to wait >10 seconds until you read what the other
has typed.

The main drawback of PSK31 is the difficulty of tuning in the signal. As
we are talking about automatic data transfer there should be
synchronisation codes included so that frequency and time
synchronisation can be done by the modem (and not the operator as for
PSK31).

If this all was not for AMATEUR radio I would completely agree with you.
But we do
experiments and for these experiments I need some information on the
equipment I'm
using.
The next thing you should think about is: do they really spend thousands
of man hours
to earn money with their product on the AMATEUR market? I doubt that
this can work.
So what do they want to do with their product? Yes, they want to sell it
to commercial
users once they get enough feedback from the experiments we do with
their products...

Of course we can't blame them for high prices because their price is
very competative. You
get a lot of good hardware for a good price - the IIe is really great.
We can only
blame them for not providing information on their modulation scheme.
Remember: Pactor-II is the *only*
amateur radio mode I know of that is not documented!

Greetings fellow hamsters,

Someone gave me an old Commodore 64 and a PK-232MBX. I have heard the company that made TNC is now out of business; is that correct ?? But, I'm wondering if this TNC can be used with my more modern PC so I can use the Commodore for a boat anchor.

Also, how reliable are the gateways between packet and the internet for sending and receiving e-mail ?? A ham who used to do packet 7 years ago said that allot of his messages were lost thru the few gateways that were available then. Reason I'm asking is that I'll be moving to a place that's 1/2 mile from the nearest power & telephone so I'll be using pv solar panels & generator, and cell-phone, and packet for power & communications.
TNX, de Bill (-. --... - -.. -.-)

Try using ferrite on the cable from the monitor to the computer.
Additionally, maybe some shielding ground on one end to encase the same
cable if a ferrite of sufficent size is not found. The noise is generated by
the transition edges of the digital signal, especially the odd harmonic
sets.

Here is some interesting reading that I found on the TAPR web site. For some it is likely old information. For others it offers a lot of good information that may answer some of the questions that I have seen in this sig.

PACTOR-II

The new Dimension in Data Transmission Technology
by Dr. Tom Rink, DL2FAK, and Hans-Peter Helfert, DL6MAA

Part 1 covers a discussion of various digital modes including PSK and Clover.
http://www.tapr.org/tapr/list-archive/hfsig/9506/msg00013.html

Part 2 gives an overview of the PTC-II.
http://www.tapr.org/tapr/list-archive/hfsig/9506/msg00012.html

Part 3 goes more deeply into the Pactor II protocol with some comparison to Pactor I.
http://www.tapr.org/tapr/list-archive/hfsig/9506/msg00011.html

The message <39289CAA.3592F1FB@attglobal.net>
from Uri Blumenthal <uri@attglobal.net> contains these words:

> Bob Sayers wrote:
> > Is anyone on this list currently using PACTOR (PACTOR-II,
> > ideally) on 50MHz? Anyone equipped and like to give it a try?

> Hopefully will be equipped by the nd of July, but probably
> will stay below 30MHz. May I ask what's so special about
> 50MHz? What do you expect to find different from, say,
> 15MHz (besides wider bandwidth available)?

Hi, Uri - it's called a British Class "B" licence, which
only allows operation on 50MHz and up!

Let me know if you'd still like to try 50 ...

regards,

Bob

2068. DIGIPAN autoseek fails

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-22 00:00:00 UTC
From: Gil Baron W0MN <gbaron@usa.net>
Message-ID: <HrhW4.78861$fF5.2741346@news1.rdc1.il.home.com>
Source record: 12804

The new DIGIPAN has a feature to automatically seek a station until it finds one. It is not working for me. Has anyone gotten this to work? Everything else seems to work well. This program certainly copies better than any of the others.

EXCEPT Winpsk aas no capture capability. It ONLY stores the current buffer WHEN you tell it to. If it had that it would be much better. It also lacks seek, even though autoseek fails.

I also like the waterfall display WITH FREQ TOO MUCH better.

Fix snap and autoseek and DIGIPAN will be even better than now and right now it IS the best IMNSHO.

From: "J. Duffy Beischel" <duffyb01@fuse.net>
Message-ID: <sijbdo1fo124@corp.supernews.com>
Source record: 12806

Yes, I like WinPSK because it is easy to use and the function keys are identified on the screen (you don't have to memorize). Works well. Others like Digipan. The only advantage I can see to digipan is that it will show you a wider "picture" of the band so it is just slightly easier to find PSK signals over WinPSK. Try them both.

Here is the link to get to all the PSK31 programs:

www.psk31.com

2072. Re: RIGblaster comments wanted!

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-22 00:00:00 UTC
From: "J. Duffy Beischel" <duffyb01@fuse.net>
Message-ID: <sijbn6eko1128@corp.supernews.com>
Source record: 12808

I had it and sent it back. Would not work in VOX mode on my Ten-Tec Omni 6+. Fooled with it too many hours without success. Took the folks about ten days to credit my charge account, but they did. Now I simply use a foot switch and it works just the way I wanted it too all along. Wish I would have done that in the first place.

Regards,

Duffy

Source record: 12809

Well Palm Telnet is different because it also does terminal emulation over a serial connection as well as providing a Telnet client. I have successfully used this with a PK232-MBX and the Palm modem cable to do 2-meter packet and I'm sure it will be usuable for all of the 232's HF digital modes as well.

I get most of the software for my Pilot from www.palmgear.com they seem to have most everything I've needed in the past.

73!

Has worked fine for me, as long as the signals are reasonably
clean. Give it a try on 20 when conditions are good and there
are a bunch of signals in the bandpass.

Same here - been hoping someone would post something on it.

The Arrow Seek works fine but the Continuous Seek, although enabled, evidently does nothing, in that I have never seen the diamond cursor move unless I used the mouse or the arrow keys manually.

Another disappointment with 1.1 is the inability to draw a reference frequency line on the waterfall. We now have the bookmarks, but on 1.0 I had a red line on 700 Hz which I used as a tuning aid for CW. If someone knows how to do this in 1.1, please post!

The simple solution is to shield the monitor. You use a special chemical
that is sprayed to the inside of the monitor cabinet. Then ground the
inside of the cabinet with a wire. (Try to spray on the wire to the inside
of the cabinet).

This technique works very well (especially when chokes etc fail).

Many Governments and Commercial companies also uses this technique to
prevent spies from reading the information on the screen using the so called
TEMPEST attacks. (i.e. a spy can read the contents displayed on a screen
by using a special RF receiver etc. For some users it is important that
these RF emissions be minimised!). It sounds like a spy could eavesdrop on
your computer activities miles a away - hi.

Hank,

A new FREE protocol has already been developed - Q15X25. It uses QPSK and 15 tones and full ARQ. Q15X25 also provides for the use of AX.25 and TCP/IP.

It is sort of a mini version of MT63 with ARQ. Q15X25 was developed by Pawel Jalocha, SP9VRC (who also developed MT63). Pawel implemented MT63 and Q15X25 on the EVM. (But others have ported the code to Linux. MT63 has also been ported to Windows by IZ8BLY. But as of yet, Q15X25 has NOT been ported to Windows. Too bad!!)

Ii understand that Q15X25 was designed to be a replacement for 300 baud HF packet which REALLY performs poorly on HF. Apparently, Q15X25 is a GREAT FREE mode for Ham radio use. (It is NOT FREE for commercial use).

There is already a FREE Linux version available that uses your sound card. Here are some more details on Q15X25:

Specifications
Error-free high speed HF digital communications,
Efficient methods for dealing with the HF channel at the physical layer,
Provide use of AX.25 and TCP/IP at higher levels,
A low-cost, self-contained hardware/software package.
Basic features
Frequency-division multiplexing (FDM) - 15 carriers spaced at 125 Hz.
Each carrier modulated with DQPSK - Differential 4-level phase shift keying.
Low symbol rate of 83.33 baud - Raw data rate is 2500 bps.
Two-phase preamble for frequency shift correction and fast symbol sync.
Forward Error Correction; Two schemes with different levels of data redundancy.
Time/frequency diversity (interleave) to de-localize burst errors.

For more information see http://www.peak.org/~forrerj/HISPEED/index.html

Q15X25 for Linux was developed by Tomi Manninen, OH2BNS. (He ported the code developed by Pawel to Linux)

As for ALL Linux programs, see http://radio.linux.org.au/

Like Packet, I do not believe that the timing is that critical for Q15X25. It should be possible to port the code over to a Windows environment using DirectX.

(But DirectX only gives you timing accuracy of approximately 10 ms AT BEST! -- Not good enough for most Pactor and AMTOR links. That is one of the reasons you WILL NEVER see a RELIABLE PACTOR/AMTOR program for a sound

card and Windows! Linux and DOS are much better Operating Systems for
implementing ARQ modes that are timing sensitive).

I hope that one day some one writes the code for Q15X25 for Windows and a
sound card!

2079. Software Based TheNet Node?

Hello,
I remember way back when that there used to be a software based TheNet
node that ran on a PC and used KISS to interface with the TNC. Is that
still available? If so, where can I download a copy?

Thanks & 73's

Jim - KD6HWC

It should be. But: using KISS for connected mode AX.25 just sucks.
You should avoid it at all cost.

First check the options to replace the KISS firmware with something more
reasonable, or drop the TNCs altogether and go for an SCC card.

Of course, it assumes that you have a lowcost monitor that does not already
have a good shielding...

Don't forget to spray the front of the screen as well! :-)

Okay folks, I've run out of things to try in getting my Toshiba 8000 laptop to receive PSK31. I can feed the audio into the laptop and hear it come out the speaker on the laptop, but the PSK31 program does not receive a thing. I can get my PSK31 program to transmit and it does a good jop sending the audio to the laptop speaker but it will not receive a thing.

My guess is it is looking for the audio from some other device and I don't have a clue as to how to fix it. Anybody else have this problem before that might have a idea as to what I need to do next? I sure would like to try PSK31 but it just seems like I have run into a brick wall on this one.

Thanks in advance for the help.

Have a look at http://www.nordlink.org

Although I would suggest not to use KISS... TheNetNode offeres other
options.

Normally it's free. Sometimes free is too expensive.

Are people still using TheNet?? Wow, talk about nostalgia...

Thanks for the info Rob, had not seen this protocol.
Very similar to CLOVER and the other "PICOLLO-like" protocols.

Software solutions in widows are always a problem, due to that timing
issue. Easy to get fairly repeatable event timing, but precision is limited
to (on average) +- 27 ms. Not too good :-(

There are many implementations.
G8BPQ is probably the most common.
Various NOS varieties: JNOS, SNOS, TNOS, etc. will do this.
Some links on my web pages, and many other places.
These will all handle AX.25 and NET/ROM protocols.

You will probably get a lot of responses that say "KISS is no good."
That is simply not true. It will work fine, and is the only available
solution which will support essentialy ALL the different TNC hardware.

Grab one or another of the above software and have fun!

Hank,

Yes, implementing any ARQ mode in Windows will likely always be a problem EVEN WITH super fast computers. Windows was NEVER designed to be a Real Time OS. DOS and Linux are much better (but still fair from perfect).

But apparently with MS DIRECTX, you can improve the timing precision from +/- 27 ms to +/- 10 ms. Most action games use DirectX to improve the performance of the game. (i.e. When you hit the FIRE button on the joystick, you do not want to wait too much before something happens. But most of the time, if the timing if even off by 45 ms, the user cannot even tell and cannot do too much about it!)

Yes, Q15X25 is similar to CLOVER. I look at Q15X25 as the next generation "Clover like" protocol. It uses 15 tones instead of Clover's 4 tones. It also uses FEC etc. More importantly, Q15X25 was designed as a REPLACEMENT for 300 baud HF packet with support for AX.25 and TCP/IP.

And lastly, unlike CLOVER, Q15X25 is FREE for HAMs to use. You don't need to buy expensive hardware from HAL. Once a Windows (or even a DOS) version is developed, I think you will see Q15X25 replace 300 baud HF packet.

I can't wait! I really do NOT like HF packet. It just does NOT work.

Dumb question, but have you set the sampling rate? I had the same
problem, forgot to rtfm.

I can not speak for Win9x, but at least in NT the normal precision is
10 .. 15 ms, as long as you avoid such stupidity as Windows timers
(SetTimer) which can have more than 100 ms variations even in realtime
priority class. Sleep and the timeout parameter in WaitForSingleObject
are accurate to about 10 .. 15 ms and with multimedia timers
(timeSetEvent) can be better than this with the expense of added CPU
load.

A better solution may cost money, varying from replacement EPROM cost to
more suitable hardware. But when talking about multiple channels (as is
usually the case for a node), better hardware may actually be cheaper.

>Are people still using TheNet?? Wow, talk about nostalgia...

The name "TheNetNode" is used for a PC implementation of the original
TheNet software (which had little in the way of originality) plus a lot of
extensions and additions.

Hmmm ... will look harder. Found some system calls that claimed better
resolution, but testing them produced the expected 55 ms granularity.
Still looked just like the usual INT 8 timer. Will look further for something
in DirectX.

With DOS I can jerk the timer around any way I want it. e.g. 5 ms. is nice
since you just hand every 11th tick off to the rest of the INT8 chain. Still
lots
of fun little issues in your timer ISR though, but at least you CAN get the
granularity you need. In windows this might be possible by writing your own
device handler ... ick. As I recall, Win NT (and thus Win2000) do not
have this problem ... 1 ms tick is available. Been awhile since I looked at
that code though.

I looked at the sources, all assembler. Probably easier to start from scratch.
Also looked at Phil's comments re HF L1 protocols. Seem to remember taking
part in some similar discussion, or maybe that same discussion, about ten years
go. Considering what is available now, in terms of DSP libraries and cheap
processing power, it makes sense to play with some new protocols.

Perhaps CLOVER was (with CLOVER 2000, still is) headed in the right
direction: a very adaptive protocol suite. AX.25 and TCP/IP are kind of
different issues. To support them, the L1 protocol has certain timing
constraints,
but other than the two issues of data transparency and frame ack timing,
any protocol should be fine at L1. Did play with running AX.25 over CLOVER,

and it can work. At least it can work for bulk data transport where it is
ok to have the ack come back 40 seconds later :-(

> And lastly, unlike CLOVER, Q15X25 is FREE for HAMs to use. You don't need
> to buy expensive hardware from HAL. Once a Windows (or even a DOS) version
> is developed, I think you will see Q15X25 replace 300 baud HF packet.

The trick here in the US is to obtain the authorization from the FCC to use
such
protocols. An STA is not usually hard to obtain, but there is a good deal of
paperwork involved. Lots of time, bother and delay. Leaves you stuck bench
testing until you have something that works.

But heck ... PACTOR I is a good replacement for 300 baud HF packet!

> I can't wait! I really do NOT like HF packet. It just does NOT work.

You can say that again! 15M and above with nice clean single hop links
will work quite well at 1200 baud. For that short period where there is
only one propagation mode between the two stations :-)

Will see if timeSetEvent has this granularity in Win98.
Thanks for the pointer!

I dunno Rob. The throughput I measure over two different 9600 baud
links, with KISS TNCs on all ends, is very very close to the theoretical
maximum. Hard for me to understand how using any other driver can
push more octets per second across the datastream.

Many years ago, myself and J. KB0QJ (SK) purchased the PackeTwin
card and Tekk radio combo from Gracilis when they first came out. We
first tried the netrom emulation of NOS and were not impressed. It had slightly
better through-put compared to the 1200 baud circuit. At that point we
started playing with the segmentation feature of NOS. Through trial and
error, we found that using 1500 bytes segmented as 512 byte packets
made these cards jump. J was 16 miles NW of me and we messed up
by ordering Tekk's at 430 MHz. That caused us to have to invest in
some M^2 beams to make it work. This was a ton of money in those
days, but it was a hobby. This link pretty much obsoleted the 9600
UUCP telco modems link we had.

When the 9600 KPC-9612 came out we noticed it couldn't compete with
NOS and segmentation. Not only that, the KISS mode wasn't much better
than the built-in netrom emulation in throughput.

Listening to a netrom 9600 is like this:

shhh.....................ack.....................shhh.................ack.......
..........shhh

A DMA card is like this:

shhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhh.........ack

That's throughput :-)

That is large frame size.
A totally different issue.

Whether the large frames were sent to the TNC using KISS, or any other
computer/TNC protocol makes no difference at all.

But you know that.

Source record: 12835

No. The TNC can't handle frames that size. The TNC's are optimized
for 256 byte packets. They don't have an mbuf allocation, just a one-size
fits-all packet allocation. In one of the old DCC issues someone actually
plotted through-put versus packet size and there was a strong peak at
256 with everything else being poor.

Just a guess, but I'd say that without NOS segmentation, and large packet
size with a DMA, you are probably getting about 1/4 the through-put
available. Just compare a 1 Meg file FTP with both and send us the
results. I think you will be surprised at how much better it works.

This is not to say that DMA is the only way, and probably a poor
solution for someone who wants to put together a node stack and
tie all the frequencies together so they don't have to spin the channel
knob...

I am going to get one of the awesome Kenwood TH-D7A hanhelds now!
I have wanted one since they came out and now I am gonna just do it, after
I have sold some equip. Now, my question is what is the difference in the
TH-D7A that AES and HRO have for $399.95 and then the TH-D7A(G) that AES
shows for $449.95?!? Can someone explain this to me please... either here
or via. E-Mail.... remove the nospam to get it there.... thanks! I am also
looking for opinions on this HT as well....

At least we now agree that KISS does not work very well. The I/O device is
not coupled tightly enough to the computer.

This can be solved with different hardware (which is not precluded at all,
usually you can get enough money from selling a stack of tncs to the unwary
ham to buy the equivalent number of SCC ports), but you can also switch the
protocol. 6PACK does not suffer from the mentioned problems, so you can
use that when you really want to keep your TNCs.

2104. Encoding / Vocoding question

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-24 00:00:00 UTC
From: "Jeremy D. Ward" <sonus@adelphia.net>
Message-ID: <392C4D74.8DDF0222@adelphia.net>
Source record: 12704

Does anybody know of any software that would allow an audio source (such as music or a voice) to be encoded to modem signals, sent through a soundcard into a 2M HAM, received and then decoded on the other end?

Any help would be appreciated.
Jeremy

2105. Pakrat-like for Linux?

Hi,

Does anybody know if there's a program runing under Linux
which can drive a TNC (such as PTC-IIe or ol' PK-232MBX)?
Similarly to, say, DOS-based Pakratt-II? I looked through
the stuff on <http://linux.radio.org.au>, but couldn't
spot such a beast among the lots of good things over
there...

No Rob, we do not agree.

I have never said that KISS "... does not work very well ...".

I won't say it, because KISS works well for what it was designed to do:
handle serial communication with an external TNC.

The claim is that other computer to TNC protocols work better than KISS.
I do not disagree with this claim. I do, however, ask for some evidence and
some test results that show how MUCH better before I decide to replace
most of my TNCs as well as the EPROMS in the one's I would not need to
replace. To date, that evidence has not been offered.

I don't find KISS "...suffering from ... problems...".
Is 6PACK now available for Kantronics TNCs?

Still curious how one can obtain any significant increase in throughput though.
Some small increase is certainly possible, for the obvious latency reasons.
But the claim is as much as 50% increase in 1200 baud networks.
I think this claim is nonesense.

At 1200 baud, there would be only a very small potential throughput
increase (I hope everyone can agree on this, it is obvious from the difference
in
data rate between the computer and RF ports of the TNC). 9600 is a different
situation, with potential for "measurable" increase. But nobody posts any
measurements, so the actual increase, if it exists, is unknown.

Under ideal circumstances, I'd be surprised if any existing serial host-TNC
protocol was significantly better than any other. However, KISS does not
handle the case of a very busy channel well; in a worst-case scenario, a TNC
would not be able to transmit a frame due to congestion, and the host
would time-out and naively send down a re-try. All of ther TNCs I've seen
will happily buffer up such retries, and, once they get a chance at the channel,
transmit them all (of course, limited buffering in a TNC might start dropping
retries, but even that's not likely, most host-TNC connections will handshake
in h/w). So, in conditions of congestion, KISS doesn't allow a host to avoid
making the congestion worse.

Some other protocol that reflects the state of the channel back to the host
might perform better under such circumstances.

Yeah, I saw some comments on the amsat reflector on this. I think they said
the 'G' version had KISS mode, and could now be used to talk to digital
satellites, that is both send and receive. (Which I'd like to try out,
actually.)

I've been playing around with using the thd7a for connecting to PBBS
systems with a laptop. I just plug in the serial port and connect. Very
easy,
really.

I'm trying to figure out what the antenna connector on the radio is called.
I went by Radio Shack, and they don't seem to have the connectors
that look right. I tried to search for some of these connectors on the
web, but I don't know what they're called, so I don't know what to search
for. I can't find the name of them in the manual. It's like a little
screw-in kind of coax thing.

Hi All,

I thought it would be a breeze! I have been copying sigs for a week. Made a few partial QSOs with the hand mike! Tough typing and moving the rubber band on and off! sheessh, Cobbled up a cable with the 100:1 voltage drop 100 ohm to ground a 10K in series, to pins 11 hot, 2 ground of the accessory socket, wouldn't throw the VOX! Tried the TNC socket pins 1 hot 2 ground 3 PTT to a key. That started transmitting immediately wouldn't stop. What am I missing here? Is the VOX, triggered by anything but the mic inputs? Seems I am a candidate for a rigblaster, though I feel its over priced!

Thanks for any help you can give!
Ben, KF4KJF/ae

Hi Ben,
I have used my 706 for PSK31 and it works fine. The problem is that I haven't used it for about 8 months and I forgot what setup I used. I remember that I didn't use the vox because I couldn't get it to be reliable for keying the tx. Also turn off the rit if it is on.
Looking at the wires that I was using, it appears that I was using the rtty plug for the connections to the radio. The rtty audio output is at a fixed level so you don't have to adjust it with the volume control, and you can key the tx with a switch or the output from the serial port. [check the manual under rtty connections, I think I was using afsk].
Let me see if I can get it going again to see if I am right. Got to go to Lake Tahoe for a few days so it may be a while before I sort it out.
Hope this helps,
Randy kr6rc

Chris,

If all else fails you can print FAXs directly from the PK232 with the use of a simple terminal program and a "Y" splice cable that connects to the PK232 at one end and at the other two ends to the serial port of your computer and a printer's parallel port. I've had this working with an old dot-matrix printer but I think it'll work with something more modern. Let me know if you want the pin-outs for the cable.

Of course this depends on the actual TNC firmware. It certainly isn't true
for the original TNC2 KISS firmware (K3MC? I am not sure), that one used
small buffers chained together to hold packets, and had no 256-byte
limitation.

The garbage from AEA of course did.

Had a similar problem with my Toshiba. On mine there are two inputs,
mic and line. Plug the PSK audio into the line input. Open the volume
control program and make sure the line input slide control is selected.
You should then be able to adjust the level.

>push more octets per second across the datastream.

An SCC card:

- does not have the latency of the KISS link. it starts transmitting the
packet when the PC decides it is ready for it, does not have to wait for
the entire packet to be sent from PC to TNC first. same on receive.

- allows precise control over the channel access, and knowledge in the
AX.25 layer of the fact that a packet has been sent. so the timeouts
are not running while the packet is still sitting in the transmit queue.

- allows low-level statistical information to be gathered by the node
software (dcd-on percentage, number of CRC errors, etc)

- does not send a packet without checksum protection over a link that can
suffer from data corruption (especially overruns), causing undetected
corruption of user data in the network.

Many of these advantages are also available when e.g. 6PACK is used instead
of KISS, while still using a TNC.

The performance difference will be seen mainly on user-access channels
where the dcd-on percentage is high (which you don't even know when you are
using KISS), and on links that have bursty traffic. It is seen least when
you are transmitting large files over low-error-rate point-to-point links.

Your benchmark was probably not very realistic for a network node, more
suitable for two users using FTP.
The difference is not about pushing octets per second, but efficient
channel access and use of time during the changeovers.

Hi,

Have someone heard about modules/systems which are capable of transferring 57.6/115.2 kbps data over a wireless link (free sight, but 2-4 km!). Both ends should have a RS232 compatible connectors and act like a cable connection.

Thanks for any hints about products (and prices/availability) in this category.

best regards

Tor

Try this link:

http://www.proxim.com/products/rl2/7910.shtml

The 7911 model has 500 mW, and that into a 21 dB parabolic will go
5 miles+ line-of-sight.

For prices, here's an example (about $440 each):

http://shopper.cnet.com/shopping/resellers/1,10231,0-11635-311-775935-0,00.html?

Thanks Steve,

However 1+ Mbps seems a bit of an overkill - and it would be nice to have
TWO for 440$;-))

Does somebody know about other 'lower' performance units...?

Thanks anyway

best regards

Different hardware.

You can always do things "better" (for most values of "better") when the
I/O controller is tightly coupled to the hardware of the computer driving it.

True for audio, video, ethernet (remember external ethernet controllers?),
CLOVER (much "better" with a P38 compared to a DXP38), packet,
disk drives (remember disk drive controllers external to the computer?),
etc. etc.

It's a female SMA connector. They're somewhat pricey, and not
available in the Radio Shack stores. (Although you can have them
ordered.)

This is not a problem with KISS (the protocol). It can, and in some
implementations
does, report back the sending of the frame. If the TNC you use does not
implement
that reporting, then of course the AX.25 code will not know when (or if) a

given
frame has been sent. Caveats about latency still remain.

2134. PSK31 Audio Connection

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-25 00:00:00 UTC
From: Dick Hughes <ragoldhughes@worldwingnet.att.net>
Message-ID: <pr5pis4dcnepppt6u87pd3unl8mbubi6pk@4ax.com>
Source record: 12720

I am getting set up to try PSK31. Before I start making up a DIN cable, I wanted to get some advice on the radio to sound card cable. I plan to use the fixed audio output from the acc 1 socket (100 - 350 mV rms) on my IC-736 to the line input of my SoundBlaster audio card.

1. Is the fixed-level (AF detector output) audio from the typical Icom sufficient to drive a SoundBlaster for PSK31? Going to use Digipan.

2. Does it make any difference which input channel (L or R) to use from the mono output of the Icom? Can I/should I tie the two inputs together? Don't have a schematic of the SoundBlaster, so don't know if this would do any damage.

Source record: 12721

I am just getting started in PSK31 myself so probably not the best source of information, but if you download a copy of DigiPan at http://members.home.com/hteller/digipan/ the help file has most of what you need to know about connections. I just received my Rigblaster and there is more to it than you might imagine. It's a lot better value at $80 than the Icom C-IV interface is at $130. (Of course not the same function.)

Similar connection from a Kenwood was a bit low for the line in,
was ok to the microphone input of a SB Live!

We recommend the Windows program "HF Wefax" by CSS (www.cssincorp.com).
Note that PKFAX was written before SVGA existed!

We do not advise using a "Y" cable, either the one made by AEA or one of your
own construction. The "Y" cable tends to radiate RFI as it exposes unfiltered
and unbuffered TTL lines to the external world. More importantly, do not ever
use the "Y" cable with the PK-232/DSP. Connecting the "Y" cable will
interfere with proper operation of the unit and may damage it. Also, do not
use a serial cable with all 25 pins connected with any PK-232 or PK-232MBX or
PK-232/DSP or HK-232. Connect only pins 1-8 and 20 to the PK-232 serial port
(use a 25 pin to 9 pin cable and this will happen by default).

The "Y" cable concept was a reasonable solution in 1985 before the advent of
Windows and system printers.

^^^^^^^^^^^^^^^^^

Exactly. And such busy channels are the normal case. On a moderately busy
low-speed (9k6) local access, there are about 10-15 stations (make this 30
stations on a rainy saturday afternoon). 3 or more KISS stations tend
to render any user access _completely unusable_. KISS is evil.

The ax.25 timer 1 must not run during the channel is busy. Therefore
the ax.25 stack has to know the channel state.

Hans-Peter,

Hank's definition of "working fine" is different from the DL/NL one.
That is why I tried it with "for small values of fine", but he does not
seem to get it...

Three thoughts:
(All of this is from the 'unofficial' PSK homepage:
1. Use a variable resistor into a 1:1 audio balun (Radio Shack) (watch
the polarities) between the sound card out and the mic in. This will
let you fine tune the audio into the rig without messing with the
digital volume controls in the computer. It really helps to listen to
your signal on a second rig to get the levels right. It is very easy to
over drive the mic input and put out a distorted (and wide) signal.
Once you get the levels configured you'll find they are reproducable.
2. Use the 2n222 transister switch from a serial RTS line to key the
rig. Much more positive and you will not have to worry about other
sounds from the coumputer keying your rig. Also helps rig keyed lock up
which was something I had (see below).
3. I had some trouble with ground looping and/or feed-back which locked
the rig key down. So I used the PTT switch and a piece of surplus cable
'tween the rig and computer. It contains two pair each shielded. One
carries audio to rig (mic in) with shield as mic ground the second wire
in the pair is the PPT from the transister switch (which is at the
computer). The variable pot / xformer is at the rig end of this pair in

a small aluminum box. The other pair carries audio from rig (actually from my audio distribution systm which includes a DSP). This shield is the PTT ground. Works like a charm and is very neat, one cable 'tween the rig and computer. Three shielded audio cables (Audio In / Out / PTT) will work here just as well.
I have a nice PSK primer in Word.DOC format with diagrams / web links etc. if you would like I'll e-mail it to you. \

If you make your I/O cable carefully and use a variable pot you will not need a manufactured interface.. Also be sure to note the settings of the digital volume control / rig's mic gain and variable pot position. Then its a no-brainer to reset and get on the air.

Icom
> sufficient to drive a SoundBlaster for PSK31? Going to use Digipan.
>
No, you'll need an op-amp circuit to bring up the level. You might get
by feeding it into the sound card's mike input. Some sound cards
aren't real clean on the mike input. Look for noise in the tuning
display with the rig turned off.

> 2. Does it make any difference which input channel (L or R) to use

> together? Don't have a schematic of the SoundBlaster, so don't know
> if this would do any damage.
>
You can tie the L and R sound card line *inputs* together. The mike
input is mono and the signal is on the "ring" (center) connection. Tip
is a bias output voltage.

For the sound card line output, use either L or R and *do not* tie
outputs together.

Hi Ben,
Checked out my setup and I am using the 13 pin acc plug for all the connections. I used a resistor bridge to limit the mike input and a transistor switch for the ptt from the serial port. The audio output is fixed so the volume control has no effect on your settings. I make all the adjustments from the sound card.

Yes of course. Thus the ACK capability of KISS, to tell the host when
the T1 timer should be started. Same situation with the T2 timer. Same
situation with hidden transmitters: if some station does not HEAR all the
stations on channel, it cannot know when NOT to transmit. These are
not KISS issues, since they are true for any host/tnc protocol.
They are also true for internal TNCs. If the software driving the TNC
does not "do the right thing" then there will be problems.

If the KISS implementation you use does not support ACK (and checksum
as well, to avoid serial link errors corrupting frames) then you need to
get new EPROMS (grin!).

Same definition, different network architecture.
We don't have channels clogged with "10-15" stations.
We provide a LOT more channels, so the stations can spread out.
Think of small local cells.

Our geography forces us to do it this way.
See a topographic map of the greater Portland/Vancouver metro area.
Everyone lives on the sides of hills, there are many hills. Many many
hidden transmitters, thus many many network access points to avoid

the collision problems.

Fortunately, very few of us find ourselves needing to use ALL the different TNC hardware. Supporting older, obsolete equipment is good up to a point, and then it's best to move on to software/equipment that is more modern and functional. This is the situation now with KISS.

KISS was once great. Now it's obsolete. When you advise somebody setting up a new node installation to use obsolete software or equipment, you are not doing them any favors. New installations should use the most modern, up-to-date equipment and software available, so as not to become obsolete so rapidly. (Not to mention the fact that the modern stuff works better!)

Which "KISS" protocol are you talking about? I'm talking about the protocol
described in the 6th CNC paper, "The KISS TNC: A Simple Host-to-TNC
Communications Protocol" by Mike Chepponis, K3MC, and Phil Karn, KA9Q.
There are no ACKs or such as you describe, by definition.

Sure, there have been some extended flavors of KISS over the years;
would you care to mention which one you're referring to?

```

6th CNC was a long long time ago (1987).

The various updates to the KISS protocol have been around since a year or two after Mike's paper was published. Heck, even Mike added a couple parameters right away, see later descriptions of the protocol.

Kantronics was the first to add ack and checksum in a commercial product. Was in the early '90s. Could dig out my notes, but not worth the bother.

The ack addition to the protocol is very simple:

1. You supply a tag value with each frame you send to the TNC.
2. When the TNC sends that frame, it sends the host a short KISS frame containing that tag value.

Thus your networking code can take the appropriate action with all the appropriate timers (AX.25 and NET/ROM) knowing when the frame was actually sent. Same latency caveats apply of course.

G8BPQ had support for this in about the same time frame, perhaps starting in version 4.05. John stated that the ack information was in fact used to adjust the appropriate timers.

At least one *NOS flavor began to support ack and checksum at about the same time. JNOS did for certain, probably WNOS as well. I have no idea whether any use was made of the ack information in *NOS though.

As with pretty much all the "packet radio" specific protocols, KISS, along with the forwarding protocol, WP update / query protocols et al do not have any mechanism for standardization. Thus I assume any reference to one of those protocols means "What exists currently".

Great ideas Charles!
My station wagon is out of date, vintage 1985.
Guess there is no point in using it any more, since better ones are available.

Anyone who writes software to be used by others does in fact
need to support all that legacy stuff, because, like my station wagon,
it can still haul the trash to the dump and pick up the kids from soccer
just fine.

TheNet has hardly changed at all in the last 8 or 9 years.
There is only so much extraneous crud you can put in a TNC2.

It is. I had an old computer network connector that fits the mic
input. Cut it off to about 5 inches and made a resistor network, think
around a 100K to about a 1 K resistor. The 100K to the sound card then
the 1 K to the 100 K and ground. The mic input audio to that junction.
Use the mic input wire and the audio out wire on the same jack. Set the
Icom unit to vox. Unplug the mic and plug in the psk interface plug.

2154. MacAPRS TCP/IP problem with iMac

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-25 00:00:00 UTC
From: khinceman@InfoAve.Net
Message-ID: <khinceman-2505001817350001@dial-6.r15.scrchl.infoave.net>
Source record: 12740

Anyone using MacAPRS with the iMac?

Have great results on older machines, but cannot get
TCP/IP access going with the iMac DV SE.

Have both port recognition and TCP failures.

Any pointers?

Tnx,

WA4VKW
Kim

Hello Roger. Be advised that this will not work with the PK-232/DSP. The
Y-cable proved to be both the source and sink for major RFI problems in the
shack.

I recommend that it not be used.

Try downloading the HF WEFAX Demo program for the PK-232MBX from
<http://www.cssincorp.com>

In other words, not KISS. A protocol exactly like KISS, only different.

That clears up the confusion. Thanks.

Thanks for the info John, I still have the Y-cable I made up some years
ago but I haven't used it for some time, can't recall any RFI problems
but it did have the advantage that any simple RS232 terminal program
would allow FAX reception. I now use the WXSat freeware program written
by Christian Bock, as well as giving great satellite pictures it has
good HFFAX capability for 120 lpm pictures.

Regards,

Roger Basford

2158. Re: PTC-II and IIe data controllers, and PTC-III to come!

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-26 00:00:00 UTC
From: Rob <Pse@NoEmail.Com>
Message-ID: <nLzX4.2213$qS3.5598@tor-nn1.netcom.ca>
Source record: 12651

I have found that other modes are much better than Pactor 1 as a HF Packet replacement. But until the developers of these new modes make them available to the HAM community at a LOW COST or make them widely available to other multimode manufacturers under REASONABLE licensing terms, I don't think that ANY of these new modes will replace the widespread use of Pactor 1.

Part of the real popularity of Pactor 1 can be attributed to the widespread LOW COST implementation of Pactor 1 in the vast majority of multimode controllers made by almost all of the multimode controller manufacturers.

In my view, the best of these new modes is Pactor II. Pactor II is just amazing. It is super fast and works well even in really poor conditions (unlike CLOVER II). In my view, Pactor II is by far the best mode but you need an expensive SCS modem. SCS has not licensed the Pactor II technology to any other manufacturer of multimode controllers. It is likely to remain a very expensive mode and used by few dedicated digital mode HAM radio operators who can afford it.

There is also CLOVER II. But I have found that there CLOVER II and Pactor 1 perform about the same when weak fading signals are involved. Some may even say that Pactor 1 is better under these conditions. In my view, CLOVER II only really shines with strong, stable signals (i.e. good S/N ratios).

Again CLOVER II is a proprietary mode. To my knowledge, HAL has not licenced CLOVER II to any other multimode controller manufacturer. But at least HAL has made CLOVER II available to the HAM community at a reasonable cost with its low cost P-38 and DXP-38 modems.

But it is a little unfair to compare Pactor 1 with Pactor II or CLOVER II. Pactor 1 uses AFSK or FSK keying; whereas, Pactor II and CLOVER II uses PSK based modulation schemes.

If you want to compare apples with apples, then compare Pactor 1 with GTOR. (Both use AFSK or FSK modulation). In my view, GTOR is clearly a better mode than Pactor 1. (Some have complained that GTOR is buggy but I have NEVER experienced problems with the GTOR implementation in the KAM. These HAM's probably have a beef with KANTRONICS or RFI problems).

GTOR is really a great mode with its three speeds -- 100 baud, 200 baud and 300 baud. It is my understanding that GTOR was based on an older Golay TOR protocol used by NASA to send pictures from MARS. I believe that the same individual who developed the protocol for NASA, also developed GTOR for KANTRONICS.

Unfortunately, there is not much GTOR activity. To make matters worse, very few BBS's etc support GTOR. I would like to see more GTOR activity

(especially for BBS use).

Unfortunately, to my knowledge, KANTRONICS has not licenced the GTOR technology to any other multimode controller manufacturer. You must use a KAM or KAM PLUS.

This is TRULY unfortunate. Most of the older multimode controllers, such as the PK-232 etc, can ONLY receive and transmit AFSK or FSK. GTOR could easily be implemented in these older TNC's. (Without a major rehaul of the hardware, you can NOT implement Pactor II or CLOVER II in these older TNC's such as the PK-232 etc).

If KANTRONICS offered GTOR to other TNC manufacturers under REASONABLE licencing terms, then GTOR might replace Pactor 1. (Just think of all those PK-232's etc that could easily be upgraded to GTOR!).

In my view, I don't think we will see a new mode quickly replace the widespread use of Pactor 1 UNTIL a new mode is made available at a REASONABLE COST to the HAM community. (i.e. NO expensive licence fees)

In my view, Q15X25 might be such a mode! It is FREE to use by Hams (but commercial users must pay a licence fee).

But like most of the newer modes (with the exception of GTOR), Q15X25 does NOT use AFSK or FSK. Q15X25 uses a more advanced modulation scheme using 15 tones. Without a major rehaul of the hardware, you can NOT implement Q15X25 in the older TNC's such as the PK-232, KAM etc. You will need a DSP based modem (or your computer's sound card!).

To date, you can only use Q15X25 with a EVM DSP unit or with a computer and a sound card running Linux.

But once a DOS or Windows based version of Q15X25 becomes available, then we may see Q15X25 replace the widespread use of Pactor 1 (Just like Pactor 1 replaced the wide spread use of AMTOR).

What do you think will be the new mode that will replace Pactor 1??

The problem with GTOR (and PACTOR) with the KAM is the interface.
For BBS use, one needs to use the KHOST interface. Played with that for
a few weeks, and did "almost" get things to work. Had many problems with
flow control, and implementing data transparency. Never got enough
requests for the support to make it worth my time finishing off the drivers.
Perhaps time to revisit the KAM drivers again.

Hi Hank,

Well, with firmware version 8.0 and higher, KANTRONICS implemented a TRANSPARENT mode for GTOR that you can access using the Terminal mode. You just enter CTRL-C B to enter the GTOR transparent (or binary) transfer mode. To exit the mode, you must send a BREAK signal to the KAM. (This mode is very similar to the PACKET TRANSPARENT mode found in many packet TNC's).

You NO longer need to use the KANTRONICS HOST mode for data transparency in GTOR!

That may make you life a little easier. Most of the time you don't need to use the binary transfer mode. But if you do use it, you must remember to exit the mode in order to turn the link around. (If you send the changeover command to the KAM in its GTOR binary transfer mode, the command is sent as data).

It is TOO bad that KANTRONICS only implemented the data transfer mode for GTOR. It did not implement the same mode for Pactor. KANTRONICS could have easily added the same command for PACTOR. With the KAM, you must use the KANTRONICS Host mode to send binary data in Pactor. TOO BAD!!

But you are right. For real flexibility, it is better to use KANTRONICS Host mode which is really a variation of KISS.

KISS only has a field to identify the type of information (e.g. data or a command to set TXDELAY etc). KISS does not have fields for the port or stream. KANTRONICS simply added fields for the port and stream. KANTRONICS also expanded the types of information in the first field -- data, command etc

The HOST mode also provides full data transparency.

But I really wish KANTRONICS licenced its GTOR mode to others with reasonable terms. Timewave / AEA could easily implement GTOR in the PK-232 etc. GTOR could also be easily implemented in PC sound card based programs running Linux or DOS. Windows as you know is a different matter - hi

With many more multimode controllers capable of running GTOR, I think GTOR would replace PACTOR 1 as a great low cost effective HF digital mode.

Start writing. :-)

Seriously, if you think this is a good idea, go for it.
Getting samples from the sound card is straightforward
under sane operating systems, and various audio compression
algorithms are available as source code. I've played with
GSM, CELP 3.2 and MP3. The fancier stuff (Qualcomm et al)
is proprietary and only available burnt into chips.

The data rate might be a bit high for 2m. Unless you *like*
sounding like a robot...

>get new EPROMS (grin!).

It's only a problem of terms.

let's talk it this way:

KISS/RAW the raw protocol without any CRC or ACK
KISS/CRC those with CRC but without any TX'd- or DCD-Feedback
(e.g. FlexCRC or SMACK)
KISS/ACK the protocol with CRC and TX'd-Feedback Hank is always
referring to (sorry, never heard about it here in
Europe)
KISS/RT those with CRC and TX'd- and DCD-Feedback
(e.g. 6PACK)

Agree?

KISS/RAW is evil.

Gruss,
Walter

KISS/POLL The host polls the TNC, the COM port may be shared
among several TNCs. (Kantronics XKISS, BPQKISS).
Checked an EPROM image and the date is January, 1992.

> Agree?

Makes good sense. Then we can talk about the same things.
These are all options in the KISS protocol as it exists now.

> KISS/RAW is evil.

KISS/POLL is even more evil (longer timing delays).

In the Kantronics TNCs, you may choose which options to use in the KISS
protocol beyond KISS/RAW. Any combination of Poll, Ack and/or Checksum.

>handle serial communication with an external TNC.

Even at that level it is poorly designed: there is no flow control and
no error checking.

But I think it is extremely naive to design a protocol to for purposes
of handling serial communication with an external device, without
considering the objectives of that communication.

To be fair to KA9Q and K3MC, that is not really what happened. KISS was
designed for use with TCP/IP, and some of the problems that plague it do
not really occur in that environment, or will not be cured by better design
at this level.
It was the later use of KISS to handle connected-mode AX.25 that caused
all the trouble.

>I don't find KISS "...suffering from ... problems...".
>Is 6PACK now available for Kantronics TNCs?

I don't work for Kantronics and do not check their specs sheets. So I
leave this for you to find out.

>
>You have evidence for this accusation?

Yes, I am personally satisfied that if any "hacking" went on, it was the Net/Rom folks who did it.

>Did you examine both source codes carefully?

Nope. Several others claim to have done so, all "experts", and their conclusions were a little too location-dependent for me to take any of them seriously. They could just have well have been discussing the Bible. After more than a decade of this, it has become apparent that the source codes are not the place to look, if good information is what you are interested in. They are too open to interpretation.

Instead, I examined the overall character and general level of accomplishment to be found in the Net/Rom and The/Net groups, and in this comparasin the Net/Rom folks came out firmly in possession of the "hind titty" position. They put a lot of energy into carping, making excuses, and grubbing for money but that appears to be as far as they were willing to go. They didn't appear to have any energy left over after all that to develop or advance Net/Rom. - Possibly because they didn't understand the code they hacked well enough to venture making any significant changes or improvements to it.

In any case, the Net/Rom clowns embarassed American Hams, and created bad feelings within the hobby with their antics. That's what they deserve "credit" for, since that was their most significant accomplishment, being what they will be remembered for by Hams around the world.

2171. DIGIPAN problems FONT and AFC

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-26 00:00:00 UTC
From: Gil Baron W0MN <gbaron@usa.net>
Message-ID: <0rxX4.91615$fF5.2926925@news1.rdc1.il.home.com>
Source record: 12749

Does anyone else have the problem that if you change the font on
DIGIPAN that it does not remember it the next time you use it?

Does anyone else think that the AFC range is too narrow. I find that I
often lose stations when I am reading the mail since they are not
exactly on frequency or even I have lost some reply data when a
station I am in contact with drifts ever so slightly.

I realize it is a free program so you can't demand too much but if
everyone with this problem let them know about it maybe it would get
fixed?

At this point, I am ready to switch to WINPSK except it has only about
a 2KHZ PAN while DIGIPAN has almost 4 Khz so that is a BIG advantage.

Message-ID: <UjFX4.92386$fF5.2944711@news1.rdc1.il.home.com>
Source record: 12660

Has anyone figured out how to add more than the 5 macros that come
with WINPSK?
I would also like to see the Function keys be available for macros but
they don't claim to support that. They do claim to allow more than 5
and I cannot get it to do so. I know it takes a restart but that does
not work either.

Charles Brain's work (http://www.chbrain.dircon.co.uk/) is quite impressive, although the audio (from my listening of the samples on the web site) is not really hi-fi -- not much worse than FM though, and in a standard SSB channel.

I am just getting in to packet and am looking for a packet program. (what is the proper name for a packet program?) I will be useing my computer at home (windows '98) and my old 486 sx33 laptop for mobile (windows for workgroups 3.11).

Can anyone recomend a good program for each machine? I may upgrade the 486 laptop for windows '95 if I can find an external CD ROM.

thanks,
Carl

Apparently a shadowy cabal* has ordained the flashy Digipan as the software of choice for people experimenting and using psk31. Don't wanna start a fight, just wanna express my appreciation for AE4JY's well-executed program. And the publicly available source code has already resulted in one major enhancement by KA1DT with the "SE" version.

When you get down to it, it's an embarrassment of software riches out there considering the newness of the mode. Thanks to all who have worked on this.

Source record: 12665

I'm quite impressed with the DVSI vocoder chips www.dvsinc.com
Charles uses the older AMBE-1000 chip, and it is a winner for voice
quality over most low bit-rate vocoders. Doesn't have that TI Speak
and Spell sound to it :-)

I got some engineering samples of the new AMBE-2000 chip and I
am trying to find an engineer who can work with the surface mount
components and produce a circuit board that I can use in telephones
and radios. My first contacts with engineers has had bids of over 10k
for the prototype stage. They must see a bigger market than I do :-)

I would like to use a TAPR 9600 modem with regenerator to make
an all digital radio that can be interfaced to the Internet. The target
being FEMA type operations, where a digital repeater can be deployed
and linked using the Internet or phone-line, or radio, to another
repeater, or an Operations Center.

I think TAPR is going to do the Charles Brain design, so we should
have a quality vocoder board to interface to.

What is the code source language?
I have it and like it but the extra macro feature does not work.
Try as I might, I cannot get more than the 5 macros.
It would be nice to have several enhancements.
1. IMD reading
2.Wider PAN so you get more than 2k.
3.Ability to use function keys for the macros
4.A frequency scale as in digipan.

I do not like digipan for one reason, the AFC is WAY to narrow and it
is EASY to lose a station if it drifts ever so slightly between
transmissions or if you are copying the mail and the two are not
perfectly netted.

Truetty is nearly useless since it has VERY wide afc and capture is a
horrible problem. It also does not copy any where nearly as well as
Winpsk and DIgipan do.
OTOH truetty is the best (only) sound card program for RTTY. of course
, don't use RTTY much anymore.

2183. PSK31 modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-27 00:00:00 UTC
From: Chuck White <cwhite@guam.twr.org>
Message-ID: <392FCF92.D34BE69A@guam.twr.org>
Source record: 12669

I've successfully used PSK31 on my old Windows 3.1 desktop and SB card. (Also found out that cheap, "SB-compatible" cards don't work!) I'd like to use my old notebook computer since it doesn't eat up the operating desk like the big computer. However, the old notebook doesn't have sound and the PC card slot doesn't work, thus obviating the addition of a sound card. Does anyone make an outboard off-the-shelf modem for use with PSK such that all computer sees is digital information? I've checked with AEA and they have nothing for PSK.

73 es thanks!

Of course, my SCS PTC2e does an adequate job with PSK31. In
addition, it supports RTTY, AMTOR, SSTV, FAX, PACKET, CW,
and PACTOR I & II. See: http://www.scs-ptc.com/ for details.

Yes I have a number of their chips and I started laying a board out for them
but it is a 3.3v part and there seems to be a shortage of 3.3v parts at the
moment. I guess it is the cellphone industry, on one part I wanted I was quoted
6 months delivery.

>
> I would like to use a TAPR 9600 modem with regenerator to make
> an all digital radio that can be interfaced to the Internet. The target

I have been recently playing with a PI/4-DQPSK modem similar to IS-54
for VHF and above operation. The eventual plan is to scale it up for
use in a full-duplex digital radio, but I am not really that hot an RF designer.
My first job was doing RF design, but I moved to S/W ASAP, in those days it paid more,
these days good RF design engineers can write their own pay checks and S/W guys are
a dime a dozen :-(

I am basing the radio on RFMD chips (well I have already bought the parts), the plan is to
use standard FM channels but will provide full duplex audio and data. I can't decide
whether
to make it a fully integrated stand alone radio or simply design it as a USB device using
those Anchor chips (or who ever owns them now).
I have heard that provided you follow the RFMD applications notes the stuff is pretty black
box.
Things have changed a lot in 15 years!

> I think TAPR is going to do the Charles Brain design, so we should
> have a quality vocoder board to interface to.

Yes they are, real soon, or so the email I received last week said.

At the moment I am porting a couple of my modems to use the TAPR EVM enclosure and trying
to finalize
my presentation for the AMSAT-UK do in July, so I have not done anymore on the radio front.

Just simply order it from MFJ. If anyone sends you theirs, it's going to have their call sign embedded in the software. Besides, use something else, Multicom sucks and MFJ has done nothing to improve it and to correct all the bugs.

Regards,

Duffy

From: Jari Takkala <takkala@host.qc.ca>
Message-ID: <pTYX4.16406$rw5.374766@news1.rdc1.on.wave.home.com>
Source record: 12682

I would like to get into packet radio, and setup a packet radio link between my network of computers at home and a friends computer. What (aside from a license) will I need to do something like this.

I assume I'll need a radio ofcourse, does anyone have any recommendations for such hardware? I should probably note that I don't just want to setup a network, but am also interested in getting into ham radio in general.

How much would I pay for the neccessary hardware to establish a link of at least 56 Kbps to my friend who lives about 2km from me?

Thanks in advance for any help!

Jari Takkala

PS. This will be a connection probably between two Linux or FreeBSD boxes.

2197. Re: Where's the love for WinPSK?

I like WinPsk when using narrow receive filters and tuning the receiver. The tuning display is much more useful for this method of operation. What I miss is being able to click on a call or name to enter it, and the extra macros. I would *not* want a wider PAN as it would do nothing when tuning with the receiver.

Cecil:

Heh, I've been in that DSL business, on the equipment side, for a while now.
As an "insider" I know a lot of "dirty little secrets" as to why putting
that stuff out is difficult and expensive.

The bottom line is that on average it is very very expensive for Local
Exchange Carriers to put DSL out there.

I'm just curious since the price of "toys" does not seem to affect your
attraction to them very much, just how much are you willing to pay per month
per Mbps for DSL service?

> 56 Kbps to my friend who lives about 2km from me?

First of all, get a Ham license. You will have a lot of fun. Packet can be
used for
networking on Linux with the built-in AX.25 software and a sound card. Look
at the Tekk radios from PacComm (web address below) and drive them with
the sound card at 4800 baud or 9600 baud. You can get some descent
throughput at those speeds over a mile point-to-point. 56k costs real money.

Alternative

I paid @ $700 for each end, and run 1.6 Mbps pseudo-full duplex (Spread
Spectrum) over 8 km. This particular system does not require a license (it uses
Part 15 FCC rules). The problem is, you need to be line of sight. There can't
be an obstruction between the two computers.

Equipment:

2 RangeLAN2 500 mW Bridge $880
2 21 dB Parabolic and tripod/mast $200
2 Andrews 1/2 hardline $200
Various connectors and adapters @ $100

I have a web page that follows my progress at:

www.usa-site.net/~ssampson/radio

Now, you can also use Ham radio, and you should probably look at:

www.paccomm.com

Look at their 56k modem. But you'll need a ton of other stuff to get
it to work. I don't think you can do it for less than $1000 per node
though.

For what it's worth...

SWBell charges $40/mo and sometimes offers a free modem. That
sounds reasonable for DSL. I don't generally buy stuff that
is overpriced. Harleys and ham radios may be an exception,
however.

>Here is Southeast Texas, SWBell *is* an ISP.

Ah, that would not be allowed here... or at least not as the only option.
So, we get the line from KPN Telecom and the Internet access from a company
that has a contract with them.

In the past we had a single company providing all the telco services, but
then we were told that this was not good because there ought to be
competition, and that everything had to be complicated with provisions
for interconnection, carrier selection, multiple ISP choice etc. to allow
that. We were told that this was the American way, and that the European
Union wanted us to have it the same way.

Don't tell us they are coming back from it over there...

It's probably old infrastructure, not even compatible with
modern data transport.

I bought into the digital cable last year. I haven't had
cable since 1975 when "Dialing For Dollars" was big
out of San Francisco (Go Janis!).

Alas, I don't get it?

When I first had cable, it was $8 a month, and the advantage
was, that there was no commercials (well, except for the
affiliates carried on the cable). Jesus, what a mess it is now.
I find myself channel changing through a hundred channels
now, trying to find something other than a commercial.

I find myself watching the Health Channel, as I find the
surgery procedures quite interesting, but just as they get
to removing the spleen they break for a commercial.

Then I toggle around and everyone is on a commercial
at the same time. Shit, no wonder Internet is fast passing
Television as a pastime...

I really want to finish my link to my ISP with another
Wireless hop. This will be 1.6 Mbps and the one link
I have now is absolutely wonderful. Sure 11 Mbps
would be nice, but Lucent can kiss my ass on their
prices. I definitely ain't giving Cox cable any more
money.

To be fair to the Bros Sproul (authors of WinAPRS), the reason they haven't incorporated more recent revisions of the Chicago Mapping software into their WinAPRS - Chicago Mapping refuses to allow it. Used to be that CM would provide a VBX file that allowed access to their maps - no more.

If revision frequency is any indicator at all - take a look at how often new versions are released. I haven't so can't say for sure - but the 'feeling' I get is WinAPRS has had more frequent updates and timely response to user requests and input.

Other that that - gotta agree with all else you've said here.

The reliability issue alone was reason enough for me to use xastir on LINUX. VERY nice and GNU public license (essentially no cost). And Frank has been nicely responsive to user input.

If speed or high volume isn't an issue, 9600 baud (or 1200 baud) may do just
as nicely. Alot of this old equipment may be found at a local [radio-oriented]
electronics swap meet.

56kbaud will require rather WIDE radio signals, while 9600 and below can use
more-or-less off-the-shelf amateur radio equipment (with an occasional
modification and/or adjustment).

Interesting,

This might explain rumors about pay raise freezes and reduction in bonus payout for management in my employer's wireless business unit. The wire-line business units are in the middle of a national DSL build-out.

Where I live it is going to be $30.00 per month!

Mont,

I was in your position just a few months ago. Not an easy decision unless you don't mind spending the money to buy both!

I tried the shareware version of both. Liked the interface of WinAPRS better, also like the map selection of WinAPRS better than SA. I believe both programs cost $60.

Both software packages allow use of more detailed commercial mapping software programs. WinAPRS can integrate "Precision Mapping" by Chicago Map Corp., HOWEVER, Chicago Maps current software no longer integrates into WinAPRS (you have to buy their older version 3.5).

APRS-SA integrates Street Atlas's software and I believe you can use their latest maps. APRS-SA's software developer seems to pay better attention to keeping the software updated. APRS-SA (as I recall) is better behaved in Windows; WinAPRS is rather 'ill-behaved' with its resource handling in Windows (both 95 & 98) and occasionally the computer needs rebooting because WinAPRS locks up the system! I have heard this complaint from others as well.

So I guess if I had to do it all over again I'd wish I had the money to buy and setup BOTH. To me, the WinAPRS interface is much nicer than SA. WinAPRS can use the DOS APRS maps (and there are a LOT of maps out there). Yet SA seems to have better support, the author keeps it updated and it can use the latest Street Atlas commercial precision maps.

Perhaps you will have to make your decision on your requirements. Do you NEED the LATEST commercial mapping software to integrate? Choose SA! Do you want the more stable software to operate in WinDOZ, choose SA!

My decision to buy WinAPRS was based on:
1. cost ($60 for WinAPRS + $16 for Chicago Maps software)
2. easier to understand interface (for me)
3. most popular, guys here run it and I depended on their help for setup

I only wish the WinAPRS author worked diligently to provide a better product and one which could use the latest precision commercial maps. APRS interest is REALLY growing, hope to see you onboard!

Best wishes with your decision!

Vic, KE4QJK

Hi and thanks for reading this.
I have written a Spectrum Analyser program (free) for the Yaesu FT920, Icom PCR1000, and Kenwood. It will run on any PC with Win95 or above. Of the Kenwoods' it's only known to work with TS 570, TS850 and TS870 so far.
Download via new homepage at http://www.mm5agm.pwp.blueyonder.co.uk
If you have a Kenwood and try the program, could you let me know the model number of the Kenwood and the result?

Does that include Internet access? Or do you get extra charges from an
ISP?
(the total cost of the above would be the same here, but it would be split
$20 for the telco and $20 for the ISP)

I'd say the choice is easy -- neither of them. Try UI-VIEW -- in
my humble opinion it is much easier and nicer to use than WinAPRS.
It doesn't integrate with those mapping programs though.

2226. Using Digipan 1.1 to Key Kenwood Radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-29 00:00:00 UTC
From: Greg Carey <gandicarey@erolc.com>
Message-ID: <8gu7heeug1@bob.news.rcn.net>
Source record: 12612

De Greg, KN4EL

I've been enjoying the fascinating world of PSK31 for all of 2 weeks. I use RCP (Kenwood's Radio Control Program) to control a Kenwood 570S. This program works flawlessly, but after setting Digipan up to use the same com port that works for RCP (I don't use the two programs concurrently), Digipan still does not switch the radio over to transmit. My guess is that Digipan does not use scripting (e.g., reg4=0;if(tx) rx; else tx;) for transmitting?

Currently, I'm using audio from PC speakers and VOX on radio to transmit PSK31. High pitched worbles used to sound nice, but the novelty has worn off with self, XYL and harmonics. :-). Using the ACC plug at the back of radio for audio (I/O) and getting Digipan to switch TXing would be bliss!

Looking forward to hear from anyone who has been able to use Digipan to key similar Kenwood radios, especially via serial port, PC side to DB9 connector, radio side.

Tnx, 73

2229. DigiPan Receive Audio Hint Needed

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-29 00:00:00 UTC
From: Dick Hughes <ragoldhughes@worldwingnet.att.net>
Message-ID: <gpt5js0hnm3hlveirm4tb3cv9qcshc3t9a@4ax.com>
Source record: 12615

I am currently using DigiPan with a SoundBlaster soundcard and Icom IC-736 radio. I am using the aux speaker output on the Icom driving the line input on the SoundBlaster. I have experimented with different audio settings on both the radio and the computer. I don't see much difference in quality of printout. I basically look for lots of blue dots in the background and leave it at that. Is there a way to achieve a more optimized receive level with DigiPan, or does it even matter? I see lots of signals that appear strong on the DigiPan screen, yet yield poor printout. Maybe they are just poor to begin with, but I would like to know it's not on my end.

Mike,

It was not SCS that made the decision to support only binary mode transfers, rather it was the WinLink 2000 authors.

It is unfortunate that PacComm didn't implement a binary transfer mode (which is the problem in your case, and not Pactor I vs. Pactor II issue). Other manufacturer's Pactor I TNC's (Kantronics, AEA, etc.) are supported by AirMail/WinLink. This issue has no relationship to SCS and/or the PTC-II series - if you want to be bitter at least aim it at the right manufacturer.

PSK31, to me, is like the microsat to the phase III type satellite.
In this case, the PSK31 mode is popular because people get to
communicate with other Hams, rather then send mail to some
anonymous machine.

If the C-64 had a sound card, it would be a killer-App today :-)

Thanks Tom. I will try it tonight, but I didn't initially because I
seem to have more than enough drive from the Icom for the line input.
I have the audio gain set at about 1/3.

On April 23, k4cjx announced that WL2K will now work in the ASCII mode, which allows cheapie PACTOR-enabled PK-232 (or the MFJ ???? model) controllers to work. See:

http://www.listbot.com/cgi-bin/subscriber?Act=view_message&list_id=winnnet&msg_num=741&start_num=758

for his announcement posted to the WinLink/NetLink mailing list

Binary transfers are apparently not a requirement. I had put my old PK-232 on the shelf and obtained a KAM+ in order to use WinLink, not realizing that PK-232 support was imminent. Wish I had waited a bit!

Hi all

My personal opinion is that this WinLink2000-AirMail alliance is definitely going in the wrong direction. Ham BBSs should be accessible using any commonly available client software. Furthermore, all WinLink2000 BBSs are interconnected via Internet, which means it becomes obvious their main purpose is to act as a cheap e-mail replacement. The fact that all tfc is compressed (unreadable by thirds) makes it very difficult to check if this network is not misused by pirates of all kinds.
It's a pity that PACTOR-II has been kind of devaluated and is being used almost entirely as a workhorse to carry binary BBS tfc. It's getting more and more difficult to find a live QSO partner amidst all these signals produced by unattended systems. No wonder PSK31 has become so popular: Behind every signal you monitor there's a human being!

In the Pegasus settings window select "transmitter" and be sure that you have "accessory input" NOT MICROPHONE selected. You have to do this everytime you launch the rig software.

Hope this helps.

Message-ID: <iUf7rvAeU5M5Ewps@peaksys.co.uk>
Source record: 12625

Does anyone know where I can find information on the Flexnet 32 bit API?
I want to add support for it to a packet application, so I'm looking for
detailed docs, not just an overview.

The purpose of a BBS is to collect and distribute messages of
a public nature. The purpose of an electronic mail node, is to
collect and distribute both public and private messages.

I propose that you want to do that at the highest speed, thus
you want to compress the data on the transport frequency.
By allowing non-compressed users on the same frequency, you
defeat the whole purpose of achieving maximum through-put.

We have to trust fellow Hams to do the right thing. We trust
them every day to not commercialize the spectrum, using modes
that can't be monitored directly.

I think when Hams finally accept high speed data pipes as
carrying pure data, it will be the day they enter the 20th Century.

If you don't want people to send "data" over your data system,
then don't put up a node. If all you want is to be a limit on
what Hams can transport, you're in the wrong hobby.

Unless you don't have enough drive from the receiver, the sound card line input is the place to inject the receive signal. Mike inputs are often more noisy. If you're getting blue speckles from the receiver noise then you have the correct level.

PSK31 is very sensitive to phase changes caused by propogation. It is sometimes possible (especially with signals coming over the poles) to have a very strong, clean sounding signal that will not print at all. Tuning is also very critical. Make sure the AFC is turned on in the software. Get the tuning as close as you can as quickly as you can and then "hands off" the dial to let the AFC do the fine tune. I leave the speaker on during the tune process as the tones help me in tuning the signal in.

Radio TS 440 S AT
I use the PSK serial PTT with no problem and control the rig (it
communicates with my logging program)using seperate serial ports!
Sounds simple enough. Serial ports are very cheap and available for any
bus. Don't know why you would want to use the same port!!!???
Mu audio comes from the speaker jack, which mutes the internal speaker,
into an audio distribution system. I can dump the audio into the
computer and adjust the external speaker volume independently. Not
really rocket science. Just takes a little planning. Using a simple
audio system allows you to adjust all your audio needs independently,
headphones, tape recorder, DSP etc. Mine isn't much more than parallel

variable pots with phono-jacks. A few swithes were added to "insert"
the DSP where I want it. QST has published a few similar circuits. You
can add 'op' amps if you want to get fancy.

Here here!!!
I've used both WinPSKs and find them great packages. Now using TrueRTTY
as it handles RTTY and PSK.
Don't know why anyone would want 'wider' frequency displays. I think
they should be narrower with adjustable 'digital' filters. With the
bands getting more crowded 'seeing' ten signals and putting up with the
LOUD ones in a band-pass is a hinderance.

Source record: 12633

Hi Jerry,

I always thought that the PK-232 could send and receive binary files in PACTOR. The PK-900 can send and receive binary files in PACTOR using either a terminal mode program or a host mode program.

Surely, the PK-232 can at least send and receive binary files using a host mode program?? Is my understanding wrong?

Perhaps the problem is with AIRMAIL. It sounds like AIRMAIL does not support the PK-232's hostmode.

I agree with others that I don't like the idea of FORCING Hams to use particular client software to link up with a BBS. In my view, the WINLINK BBS's should continue to accept simple commands using ANY TNC with ANY client software. (I have no problems with HAM's who want to use AIRMAIL. But it should be an option)

For portable use, I like using a small portable dumb terminal that runs on a couple of AA batteries. These terminal are very inexpensive these days and are VERY durable with NO moving parts like hard drives etc.

You also don't have to worry about damaging an expensive laptop when hiking, camping etc. Unfortunately, I can't access some of the WINLINK BBS's with this dumb terminal NO MATTER what TNC I am using.

I am not going to buy a second hand laptop for my hiking and camping trips etc. They are simply not very durable.

I thought one of the purposes of WINLINK was to allow portable stations to send and receive Internet EMAIL. I guess it was really designed for more permanent portable stations (like Marine Mobile). What a PITY!

There! There! ($1 to Firesign Theatre)
Alas, those of us without righteous digital filtering before the receiver AGC will still have to tune around to dodge the strong signals. Murphy says they will always be less than 100Hz from the VK station that's finally got a good path to me at a reasonable hour in Alabama USA. One thing that works is to reduce the RF gain to the point where your signal is just visible and stronger ones don't hit the AGC too hard. If possible, switch off the AGC (duh).

Digipan is nice. I used Digipan at a club program a couple of weeks ago. PC to PC, from speakers to mic input. The wide screen (and switching to REALLY BIG FONTS) helped the demonstration a lot.

Can't wait to put my Linux box together and see the Gnome and KDE implementations of psk31 software.

WinLink stations CAN do both, but normally only handle private messages.

The WinLink "transport frequency" is the internet. All RF use of WinLink
in it's "AirMail" incarnation is from user to host. i.e. it's a bunch of
RF email drops hanging off the internet.

> We have to trust fellow Hams to do the right thing. We trust

Ever since the original author of WinLink allowed someone else to
take over development of the system, it has moved more and more
toward a closed, proprietary system. Forcing (or attempting to force)
the use of WinLink-specific clients appears to just be part of the
strategy: to lock out competing software. Keep in mind that the commercial
use of WinLink and similar systems can produce a good deal of income.
You only need to "beat" Inmarsat on price, which is probably not hard.

Well ... the value of bulk transfer protocols like PACTOR-II and CLOVER
is that they work very well for BBS-BBS movement of messages. This allows
hams to time-shift: i.e. carry on QSOs with other hams who are not on the
air at the same time, etc. It's real convenient. PSK31 is not useful for this
mode,
so all use will, by the nature of the protocol, require a human to interpolate
the errors out of the datastream.

No. Right now we have Hams who sit by their consoles, monitor
the contents, and then shut off the node, or jam the person off the
air. "We don't allow BBS data on our Nodes." or, "We don't
allow keyboard to keyboard on our nodes." These type of silly
antics.

By "pure data" I mean, it's all just data, not denoted by content.

Cheryl at Kantronics wanted me to pass this along.

HRO has both the Kam Plus and the GPS Tracker avaiable and in stock. Both of these models from Kantronics are discontinued and the Kam Plus has been replaced by the Kam '98. This is a clearance sale for HRO on these units.

HRO is offering the Kam Plus for $329.95 and the GPS Tracker for $349.95. Both are great deals for both the DXer/Digital user and the APRS hobbiest.

Info on these deals is at http://www.hamradio.com

Rob,

Both Randy Gawtry and I worked with Hans Kessler and Jim Coreman on how to do the binary transfer modes in Pactor with the PK-232/900/2232/232. One of the issues was that the PK-232/900/2232 sends out a serial number when a WRU is sent (it's something that was put in during the last days of AEA and no one seems to know why). We gave them the method that is used in PakRatt to avoid this issue and I assume they decided not to support that, but just the ASCII mode transfers.

PcPakRatt has been doing YAPP binary tranfers for years with the PK-232, as well as the next version of PKTerm, which will support YAPP in Pactor.

Hi Rick,

Yes, the problem rests with the NON STANDARD Pactor implementation in the PK232 and PK900. The PK-232 and PK-900 sends a serial number of the EPROM whenever it receives the WRU character embedded in a binary file sent from the other station the PACTOR. To my knowledge, NO other TNC does this.

I just read the WINLINK archives on listbot.com. I think you are referring to Timewave's suggestion that the WINLINK station just ignore the serial number received from the PK-232 or PK-900 (in response to receiving the WRU character from the WINLINK station which is part of the binary message sent from the WINLINK station).

In my view, that is not a great solution. When receiving a binary file, the PK232 and PK-900 should NEVER seize the link and send data in response to receiving the WRU character.

It REALLY slows down the binary transfers!!!

In Pactor, the WRU feature is completely unnecessary since the Pactor protocol provides the callsign of the other station. I do not believe the WRU feature is EVEN part of the Pactor protocol. In my view, the WRU PACTOR feature in the PK-232 and PK-900 is really a bug not a feature.

The PK-232 or PK-900 does not exhibit similar behaviour in Packet. Why does it do so in Pactor?? Perhaps, AEA implemented this "bug" to discourage people from illegally burning their own EPROMS.

In my view, it would be MUCH better if Timewave realises that AEA made a mistake in implementing the Pactor protocol and capitalises on the opportunity to remove this PACTOR "bug" in the next release of the PK-232/PK-900 firmware. It would really speed up binary transfers! It should be very easy to fix.

With the PK900, I believe you can turn off the WRU feature (with one of the USEBIT's) in ASCII mode but I believe the USEBIT setting has no effect when the PK-900 receives a WRU character in the binary transfer mode. This looks like another bug.

In my view, it would be better and simpler if Timewave completely removed the WRU feature in the PK232 and PK900 in the PACTOR mode. I can see NO reason for implementing the WRU feature in PACTOR. As I mentioned, I do NOT believe that the WRU feature is EVEN part of the pactor protocol. When you link with another station in Pactor, the PACTOR protocol provides the other station's callsign. WRU is completely unnecessary. I have NOT seen ANY other TNC manufacturer implement the WRU feature for Pactor.

Typically, the WRU feature is an optional feature for the AMTOR mode. It provides BBS's a method to automatically obtain the other station's callsign since the AMTOR protocol only provides a 4 or 7 character SELCAL. Most TNC's (e.g. KAM) only implement the WRU feature for AMTOR.

If you don't want to remove the WRU feature in PACTOR, then optionally provide separate USEBIT's to turn off and on the WRU feature independently for AMTOR and PACTOR. But make sure when the WRU feature is turned off in PACTOR, it is completely turned off during binary transfers.

In my view, Timewave should seriously consider fixing the AEA bugs and implementing the PACTOR protocol properly (at least for binary transfer's in Pactor!) in their next release of firmware for the PK-232 and PK-900. It should be VERY easy to fix.

Many PK232 and PK900 owners will thank you!

73's
Rob

Rob,

One of the things that you have to watch out for, is not to break something since it wasn't a bug, but a design decision. I do know that WLO and Globe Wireless do use the WRU for their ID. As I said, it's very sketchy why it was put it (it was during the Rod Proctor days at AEA), and I'm sure even Mike Lamb (former owner of AEA) doesn't know the whole story on why Rod mandated it be put in.

One of the things Randy and John (Douglas) did acknowledge in the conversation with the Winlink people, is that if there is a future revision of the firmware, then they'll look into putting in an option for turning it off. This has been acknowledged from the very beginning and I know they are people of their word.

However, I don't think many hams or mariners would be willing to spend $50 for a firmware upgrade just to work around an issue that can be worked around in software. The installed base is what is important, and personally I feel that since Winlink is free, it's silly for someone to have to pay for a firmware upgrade just to use free software.

And it really doesn't slow down the transfers if implemented correctly. We did some in house testing with it, and found with YAPP an Pactor, we'd get 75% throughput in most cases, and this was with large files. I think the issue may be with the F6FBB protocol, which wasn't designed for Pactor (it's a packet based protocol).

Also, you could work around it by using the transparency characters... this way, the TNC would never even get a <CTRL-E> and wouldn't trigger the WRU.

I guess it's easier to work around things in software, than ask an end user to upgrade their firmware which would cost them $$$$.

And yes, 1.5 of PKterm which will support YAPP with the current proms, will be a free update for our userbase.

As a former prisoner of Klamath Falls, that sounds pretty
much like something they would do.

I always wondered where the Falls were in Klamath. Turns
out they were referring to the rock falls which kill tourists
every year in their campers and motor homes on Highway 97...

I used to have JNOS system camped out on 145.01MHz, essentially as a
PBBS. There was no IP gateway functionality. Several years ago, shoot,
it might five or six, if not more, I noticed that someone had connected
to me apparently from the Modesto area (several hundred miles away).
Wow! Must have had some unusual 2m conditions, but they'd faded,
leaving a lingering connection. Too bad I hadn't noticed it at the time.

A few weeks later, I received a letter in the mail, with no return address
and a postmark from Stockton (if I recall correctly). The contents of the
envelope was a photocopy of the Northern California Packet Association
plan, with "145.79 TCP/IP Systems" marked in yellow highlighter.

At first I was mystified; why did someone anonymously send me the
packet bandplan for Northern California even though I'm in Los Angeles
County? Eventually, I realized that my transient visitor had noticed "TCP/IP"
was available at my station and wanted me to conform to the NCPA bandplan.

Forgive me for being so frank, but I eventually chalked it up to another spineless
ignorant amateur radio control-freak.

In the early days of packet (much longer ago than that), there were a few
guys here as well that did not get this, and wanted to setup separate
frequencies for TCP/IP. Even for the links.

But when I developed a combined TCP/IP and NET/ROM node, and showed that it
could operate as a node of the type familiar to everyone and route IP at
the same time, these voices faded and the separate networks fortunately
never appeared.
(although that now probably means the IP network will get lost in the
battle over a better replacement for NET/ROM. most candidates do not route
IP...)

However, this is not an issue related to the original topic of this
discussion. It is more like this: F6FBB BBS supports both keyboard
connections and an interface for more advanced clients, that retrieve their
messages in compressed mode and using a protocol that more resembles the
forwarding protocol used between FBB BBSes.
What if the author suddenly decides that the keyboard mode is no longer
required and that only users with programs that implement the special
protocol are allowed to connect to the BBS?
Would you be happy? Probably only when you happen to use one of these
special programs, not when a program is not available for your machine
and/or you have to switch to another program.

I am interested if anyone comes up with better ideas. I think I will
check with TimeWave and see what they suggest!
I have tried 2 ways, both seem about equal. I usually operate with my
narrow CW filter on in the rig then set my 599+ as follows:
1. CW mode @ 1000 Hz center freq and narrow the band pass as needed
depending on band conditions.
2. Voice mode and bring the bottom up and top down as needed.
-- I find in crowded conditions, as we have had lately, that there are
times I get under 100 Hz bandpass and just copy 1 signal using the rig
to tune in a station. Of course this takes away the computer tuning but
it sure helps to kill a LOUD signal next to a weak one.

Yes, It's true that the US amateur tcpip community have been idiots,
alienating Hams on a large scale basis with their rude, ignorant behavior. -
But, as you pointed out, the problem is self-limiting. When Hams get
exasperated and tell them (tcpip goons) to take a hike, the arrogant,
ignorant behavior is no longer a "problem". - Is it? ;-)

I applaud the node-ops in Southern Oregon who have drawn a line against the
rude, ignorant behavior of amateur tcpip goons in their area. A little more
of this type of courage, and amateur tcpip goons everywhere will either
learn to get along with others for a change, or just plain take a hike and
stop acting like a pimple on the Amateur Radio community's butt.

This is main reason why I'm not on TCP/IP any more. And an amusing
thing is they are arrogant about a technology that runs just about
as slowly as the format a: command did on my original 4.77 MHz IBM PC.

I work with digital radio as you may see from my address in the header.
But, I decided to not stomach their attitude.

K. Falls and a few other rather similar places.

The same folks who built a "network" by putting all the nodes
on one frequency ... and then complain when anyone tries to
use them because using them causes "congestion".

There was a similar "network" in Eastern Oregon/Washington.
At one time there were 27 or 28 nodes, all on the same frequency!
I think they are mostly gone now.

You may be surprised that the entire Internet as you know it today uses
those same protocols. In fact, the amateurs that introduced TCP/IP to
packet radio did so at a time most people did not know what the Internet
was or would be.

It is not TCP/IP technogogy that is slow, it is the modem technology used
by hams that is making it appear slow. Most packet users today still use
the 1200 bps AFSK modem that was chosen more than 15 years ago as a quick
way to get things running. Even the fact that the modem chips were
discontinued by the manufacturers one by one has not awakened them.

Source record: 12559

Hi Warren,

I have a NEC PC-8300. It is very small with a small LCD screen -- approx. 8 lines by 40 characters. There are other models with larger screens (e.g. 40 lines by 40 characters). NEC also made the same computers for Radio Shack which were branded under the Tandy name in the 80's.

It is really a small computer. It has its own Operating System (OS), built in BASIC interpreter for your own programs, built in word processor and a built in terminal program. The OS and programs are all burned into a ROM. There is No waiting when you turn on the PC-8300. You just select whether you want to run of your BASIC programs, the word processor or the terminal program.

It has 32 KB or 64 KB of RAM to hold your programs and word processing documents. The RAM is backed up with a small rechargeable battery.

It also has one serial port and one parallel printer port. There is also a built in modem (1200 baud I think. High speed at the time)

There are NO disk drives, no moving parts. There is a port to hook up a cassette player to record and store your programs and documents.

These type of computers were very popular at the time. They were the first TRUE notebook computers. You could easily put one in your brief case and use it to write letters and memos.

Workers in many industrial plants also used them to hook up to remote microprocessor based computer systems located throughout the plant. (e.g. factory automation etc). They are VERY durable (since there are no moving parts).

These days, people tend to use the much smaller Palm Pilots or similar devices (with their much smaller screens) for similar applications.

Look around at flea markets or on EBAY. You should be able to find a NEC PC-8300 or one of the TANDY clones. If you can try to find one with a bigger screen. I wish I acquired one with a bigger screen years ago.

I really like the PC-8300 small dumb terminal mode for use with my packet or Pactor controller when going portable or mobile. It is very small and convenient. It also does NOT generate any RFI (unlike my PC's monitor).

Good Luck

73's

I agree, especially since a LOCAL bandplan is just that - local - and in this case, the bandplans DON'T match. This can sometimes be a problem where adjacent areas overlap (or when propagation causes an unusual overlap).

The bandplan for Southern California is at http://www.qsl.net/scdcc site (click on bandplan - the exact file may have its URL adjusted in the near future) - and adjacent areas have links, either at the bottom of the bandplan page or via the links page to the other neighboring organizations - just for reference.

I also agree that this guy should have noticed that you were in a different geographic area (he obviously found your address - duh!). He needed to be educated that California is split in two for coordination, and in FOUR pieces for packet bandplans (roughly corresponding to the WestNet BBS indicators #NCA, #SCA, #WCA, and #CCA - with #SCA and #WCA being the closest matching plans).

I also find it strange that at that time, 145.79 had APRS.....

Den,
Your settings are about right - you have correctly used the flexibility of the DSP-599zx to accomodate varying conditions.

You might want to watch the Timewave website for a June announcement about the DSP-599zx. Operating PSK31 with the DSP-599zx will be a little easier, among other things. Please don't call or email until you see an official Timewave announcement - we'll never get done if we get 3,000 phone calls and/or emails! (Note, Timewave policy on newly purchased units is to provide free upgrades for any unit purchased within the last 90 days before the upgrade.)

Great reply! I would have thought Motorola was hiring more
intelligent engineers.

The fact that TCP/IP was conducted at 1200 baud is the only reason
these people find fault with the data. If it was at 100 Mbps they would
argue just the opposite. "Hey, you rude ignorant bastard, you can't
run AX.25 BBS protocol on 100 Mbps Ethernet!!"

But really, at that speed nobody gives a shit. Only at 1200 baud do
we have people pissing all over themselves, waving their arms about,
and frothing obscenities.

Oh well, I'll use my Part-15 stuff...

For Internet use over the landline, a "usably fast" modem can be found almost anywhere for around 100 bucks or so. Very often bargains can be had to cut this expense in half, but these bargains cannot always be found at the local discount store in almost any town, so for fairness' sake, let's work with the 100 dollars price as a given. For this 100 bucks, I get a generic modem that will work with just about any PC with terminal software and drivers for Macs, Linux, DOS, Win3.x, Win9x, Win2000/NT. It will also work on just about any typical telephone line/connection.

OK, where's the comparable "usably fast" Packet modem that comes with software for a variety of platforms and works with just about any typical radio, all for 100 bucks or less?

I think a lot of folks are getting sick and tired of hearing tcpip goons blaming "Joe Ham" over matters that are far beyond "Joe Ham's" personal interest or control. Here you are, in effect, blaming "Joe Ham" for not "waking up" to a situation that does not exist, because to understand his motivation, you'd have to face a few facts that you do not choose to face. - So poor old "Joe Ham" ends up once again being your excuse, your scapegoat. This is the ignorance/arrogance from tcpip goons that many hams are no longer willing to tolerate. All that whining is getting kind of old.

Fact is, "usably fast" Packet Radio/Modem combos are significantly more expensive, more complicated, more difficult to find, more difficult to get help on setting up, less reliable, and much harder to find someone else to talk to with than the slower, cheaper, easier, more widely used stuff that 90-95% of all packet operators use. To run down "Joe Ham" for not being so interested in tcpip that each any every one of them would be willing to go to a lot of extra expense and trouble over it is just plain unreasonable. - It ain't going to happen in the present market, not on any significant scale.

"Joe Ham" does not see amateur tcpip as being worth a lot of additional expense and difficulty to do right, does not wish to do it (tcpip) wrong (slow), so he works with what works well with commonly available, inexpensive (slow) equipment and allows access to a network that offers somebody else to talk to in thousands of more places than expensive, complicated high-speed stuff can even start to offer. He wants to use widely available equipment, reasonably priced, that is simple to set up and use so that he can "talk" to the other "Joe Hams" out there. "Joe Ham" is not an experimenter, and expecting him to be one on a wide-scale basis is just plain stupid.

Next time you find yourself ready to heap a lot of blame on "Packet Users", try examining your own basic grasp of the facts of life first. Your negativity originates within yourself. Blaming "Joe Ham" for the situation is equivalent to searching for a lost wallet under a bright street light because it was too dark to see anything in the alley you actually lost it in.

As long as doing tcpip right requires equipment and software that is significantly more expensive and difficult to utilize than the standard run of the mill Ham equipment, it will not be used on a wide-scale basis. Get over it, move on.

Instead of unreasonably expecting thousands of "Joe Hams" to suddenly become experimenters, try asking yourself why high-speed radios and modems are so hard to find, so complicated to set up and run, so expensive, and so difficult to standardize so that when you buy the stuff and hook it up, you cannot reasonably expect to find someone else out there that you can "talk to". These are the realities behind the general resistance to utilizing high-speed/tcpip, not any deficiency on "Joe Ham's" part. Get off his back. Get real.

2277. DSP settings for PSK31

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-05-31 00:00:00 UTC
From: Mont O'Leary <moleary@rbci.com>
Message-ID: <zM_Y4.18$xM5.1043@news.flash.net>
Source record: 12647

Any suggestions for DSP settings for PSK31? I am using WinPSK and have a Timewave DSP-59Y (which is the same as their DSP-599+). I have been using it in voice mode with High Pass set to 100 Hz and Low Pass set to 2200 Hz. The FT1000D is set in PKT/LSB mode with bandwidth set to 2.4 KHz.

Like the nodes in Southern Oregon that have an ID string that says
something like "No TCP/IP allowed on this frequency!".

Idiots.

Hi Rick,

I appreciate that the WRU feature implemented in the PK-232/900 in Pactor was a "design decision" made by AEA (not by Timewave). I am just questioning whether this design decision makes any sense.

I have never seen the WRU feature implemented by any other TNC manufacturer for Pactor. The WRU feature is typically only implemented for AMTOR. But I am sure there may be some commercial users who may find the WRU feature useful in Pactor (if they want more than just than callsign provided by the Pactor protocol) in the ASCII mode.

But from my perspective, the WRU feature does not make any sense when receiving binary files in the transparent mode or host mode (especially if the PK-232 and PK-900 simply sends the serial number of the EPROM as the WRU text).

I don't think it is fair to point fingers at the F6FBB protocol. In my view, PACTOR was designed to send and receive the FULL ASCII character set including graphics characters etc in the binary or transparent mode. It was designed to be a replacement to H.F. packet.

Until I read the posts in this thread and on the WINLINK reflector archive, I always thought I could receive (and send) any binary file in the PK-900 Pactor TRANSPARENT mode (just like receiving a binary file in the Packet Transparent mode) using a SIMPLE DUMB TERMINAL program.

But the PK-900 manual does mention that you can turn off the WRU feature for BOTH AMTOR and PACTOR at the same time using one of the Usebits. But I don't think the USEBIT setting has any effect when the PK-900 is receiving binary files in the Pactor transparent mode. From my perspective, this is very strange and makes little sense. If I am wrong, please correct me.

I would prefer to see separate USEBITS to turn on and off the WRU features independently for AMTOR and PACTOR. (i.e. Turn on the WRU feature for AMTOR and turn off the WRU feature for Pactor).

I agree that most HAM's probably won't want to pay $50 just for an "improved" or properly implemented WRU feature in Pactor and AMTOR (if their PK-232 or PK-900 already has the Pactor upgrade EPROM).

I am very glad to hear that Timewave will consider improving the WRU feature if they decide to release a newer version of firmware for the PK-232 and PK-900 in the future.

But Timewave still receives orders from Hams for your excellent DSP upgrade (or even the simple PACTOR non DSP upgrade) for the PK-232 and PK-900. If

it is not too difficult, why not supply a newer version of firmware with an "improved" WRU feature in Pactor for these customers? I am sure these customers who are just purchasing your DSP or firmware upgrade for the PK-232 and PK-900 would appreciate it. You may also get some customers purchasing the firmware upgrade just for this feature (especially if they want to send binary files using Winlink or even a simple terminal program).

I wouldn't think it would be very difficult to release new firmware that provides an option (e.g. USEBIT) to completely turn off WRU in the Pactor Transparent mode (or host mode) in the PK-232 or PK-900.

Rob,

One of the things that you have to watch out for, is not to break something since it wasn't a bug, but a design decision. I do know that WLO and Globe Wireless do use the WRU for their ID. As I said, it's very sketchy why it was put it (it was during the Rod Proctor days at AEA), and I'm sure even Mike Lamb (former owner of AEA) doesn't know the whole story on why Rod mandated it be put in.

One of the things Randy and John (Douglas) did acknowledge in the conversation with the Winlink people, is that if there is a future revision of the firmware, then they'll look into putting in an option for turning it off. This has been acknowledged from the very beginning and I know they are people of their word.

However, I don't think many hams or mariners would be willing to spend $50 for a firmware upgrade just to work around an issue that can be worked around in software. The installed base is what is important, and personally I feel that since Winlink is free, it's silly for someone to have to pay for a firmware upgrade just to use free software.

And it really doesn't slow down the transfers if implemented correctly. We did some in house testing with it, and found with YAPP an Pactor, we'd get 75% throughput in most cases, and this was with large files. I think the issue may be with the F6FBB protocol, which wasn't designed for Pactor (it's a packet based protocol).

Also, you could work around it by using the transparency characters... this way, the TNC would never even get a <CTRL-E> and wouldn't trigger the WRU.

I guess it's easier to work around things in software, than ask an end user to upgrade their firmware which would cost them $$$$.

And yes, 1.5 of PKterm which will support YAPP with the current proms, will be a free update for our userbase.

> awakened them.

I fully agree that 1200 baud is the cause for the slowness. And, back then, when packet radio and TCP/IP were introduced we had to start somewhere. In fact, one previous assignment I received at work to develop system requirements for cellular packet data was directly related to my earlier ham radio background. Now I had the challenge of "doing it" at 800, 900, and 1900MHz, trying to keep the link up at 64K, and finding a way to bill the end-user. There is a new generation of congestion problems just beginning to be addressed ... 64K vs. 1.2K is not the cause ... now its where did that million people trying to access the network at the same time come from? :-)

I'm as guilty of this as the next ham, which is in ham radio we still spend a lot of time concentrating on the link layer. We now have the links in place (more or less). The next value-added proposition is to build up the application layer. This is not directly amateur radio related so I'm not sure we'd find many to sign on to develop applications linkable via the TCP/IP infrastructure.

Most of the reason I keep my amateur radio license now is due to my volunteer work with a local county emergency management agency. We've been looking for applications to link remote sites such as shelters and staging areas back to the emergency operating center. A few exist (ARESData); these also are a good beginning. Trying to track which people are at any given shelter, or how much construction equipment or food is at a staging area is a database application problem and not really too interesting for the average ham.

When an incident commander wants to know if he/she has enough food to feed the people at a shelter he/she won't really care if the answer comes back via 1200 baud TCP/IP. The application layer provided the answer.

Take care,
--

"The time" was 1984, the same time I introduced the packet BBS.
One caught on, the other didn't. Why was that? Ease of installation and use.

> >It is not TCP/IP technogogy that is slow, it is the modem technology used

"... awakened them..." to what? I think all hams interested in building and
using RF networks are well aware of the problems. The high speed modems
available simply cost too much.

Nothing out there at all. Zero. Zilch.

<deletia>

There is also the problem of software that runs on Windows, is easy to
install and understand, and actually works. None available

> Instead of unreasonably expecting thousands of "Joe Hams" to suddenly become

Even if Joe Ham were interested in tcp/ip, he doesn't want to spend weeks
trying to get some arcane software running. He wants to USE the software,
not play with installing and configuring. There is none available yet that
meets
these criteria.

Mainly there is no need to build those applications. They already exist.
When I "do packet radio" mostly I use Outlook Express, various ftp
and telnet clients, IE5 or Netscape 4.73, etc. etc. This capability has
been there from the first availability of tcp/ip over packet radio in 1984.

Error correcting would be useless in PSK. It is too slow to spend the extra
effort and for that reason is usless for binaries, so why bother?
PSK is and will stay a keyboard to keyboard or it will not be what it is.
Now a WIDE band versiin might be something to think about but that is another
story.
BOY I hate using someones AOL with no spell checker for newsgroups!

All looks good to me. You do not really need a dsp though. With winpsk or
digiapna you need the wide bandwidth and so there is no need for anything else.
It is the goood and bad of those programs. You have the convienience of eas of
use but if there is a LOT of qrm, you do not hvae the narrow filters to help.
In most case and most radios, they don;t't help in any cae.
The best thign to do in that case is to tune in the staion and tiurn off the
AFC to prvent catpure effect.

I think you are completely wrong here. Anyone can develop applications
that use today's webserver/browser technology, which is layered on top of
TCP/IP. It is simple to write perl or php scripts that run on Apache, or
scripts that are run by Roxen, or on Microsoft IIS.

The fact that this is so simple is because the entire protocol stack
is standardized from the IP level up, and in wide use on the Internet.
Hams can transport IP trough their network (as far as it exists).

No similar capability exists for bare AX.25 networks. Of course it could
be built, but it would automatically mean having to design both servers and
clients. Sure, amateurs have done this. But today it does not look like
the way to rapidly improve the application situation.

I'd be a little cautious, since there are more and more 3.3V chips out these days
that might not tolerate 5V.

Hello Bruce,

you haven't been pushy.
Simply, I'm very busy with my job and reply just occasionally to all the
YAM-related e-mail.
I apologize for this practice, but it's not so easy to handle a
world-wide interest by a single man, nor I was prepared to receive it.

I remember that when I developed the YAM (July 1997), I asked Andreas
Gal (the author of the popular "TFX" TNC emulator) the sources of his
software in order to add support for the new modem. He never sent them
me and only after some months I got them, thanks to the initiative of
Peter Guelzow, DB2OS.
Only after a while I could understand Andreas' behaviour.

Maybe tomorrow you will develop something new and receive twenty, fourty
or one hundred e-mails per day. By then you will discover how hard could
it be to reply even to one of them, taking care of your God, your family
and your job at the same time.

2295. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-06-02 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <8h7ffkiji1@news.hawaii.edu>
Source record: 12581
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.dx

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any amateur topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and its
content drifts further and further away from being "on-topic" in the
various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman, KH6O

Hey! Thanks for the great advice! I now know what to tell the Director of the Office of Emergency Management the next time he is looking for technological support from the amateur radio community! I'm sure this method will earn an honored place in his emergency services plan serving over 1,000,000 people. What impact! :-)

Application situation? -- Just exactly what "situation" is that?

Fact is, we are swimming around in applications, and when "new applications" are seriously discussed, nobody seems to have any idea what these "new applications" might be. This is because there is no particular need for new applications. The only people talking about an "applications situation" are tcpip goons who appear to "think" that it serves their purpose to create an atmosphere of discontent within the hobby with vague, unsupported claims about a great "need for new applications" that simply does not exist.

Yes, that kind of activity is stupid, destructive and ultimately self-defeating but after all, this IS the amateur tcpip community we're talking about.

Hey, I've got an idea! Why not just blame the whole situation on "Joe Ham"!

Oh, sorry: I'd forgotten that you had already tried that.

Rob, you're not as "eaten up" with the typical amateur tcpip stupidity as many of your fellow enthusiasts, but still you end up mindlessly parroting the same old catch-phrases and spreading the same negativity about the hobby and it's participants that has become the hallmark of amateur tcpip.

When amateur tcpip enthusiasts develop a preference for the truth and stop trying to utilize old outdated propaganda technique from the 1930's to undercut the hobby, I for one will simultaneously develop a great deal more respect for them. (And you.)

What "applications" do you want?

Everything from email to chat to file transfer is available trivially.
You want web pages? Just put 'em on air, it is NO big deal.
Anything you can do on the internet you can do over ham radio.

If you want something SPECIFIC then let us know WHAT it is you want.

Rob,
I checked in some of our archive Hitachi data books. While I didn't find the precise part you mentioned, generally Hitachi medium speed SRAM with an LL suffix is low power standby current (spec'ed at 15 uA vs. 50 uA normal). We have used this type of SRAM in various projects over the years and have had no problem with the LL or equivalent version from any manufacturer. (Backup batteries last longer and resetting the SRAM to all zeros by pulling the battery may take a lot longer!)
Most ICs are in very short supply at this point, so you will find problems obtaining many parts at low prices with fast delivery.

The HY628100A is not a Hitachi part but a Hyundai part. Go here for a PDF data sheet.

http://kcs.hei.co.kr/models/sram/sramcomp/1M/HY628100B.PDF

This part only comes in the SOP and TSOP-1 package (according to Hyundai). I'm assuming that your's is in a plastic DIP package? If so you can get a similar part from BG micro for cheep.

I already have an external DSP filter. I really don't need the DSP upgrade (even though it does have some advantages such as adaptive DSP filters for Pactor).

It is too bad that you don't just offer a firmware upgrade for the old PK-900's (like you do for the PK-232MBX).

Sometimes I wish that AEA was still around.

Many thanks for the link.

I will use the Hyundi SRAM chip. It is about half the price of most
compatible SRAM chips.

It costs less than $10 US.

Hi Dana,

Thanks for the warning. But it was just pointed out to me that the chip is made by Hyundai not Hitachi.

Details at http://kcs.hei.co.kr/models/sram/sramcomp/1M/HY628100B.PDF

It is a TTL chip. It looks like it will tolerate 5 volts just fine.

For a KPC-3, the LL low low power SRAM chips look great. And they cost a lot less.

Hi Randy,

I just found out that the chip is a Hyundai chip NOT an Hitachi chip.
Details are at http://kcs.hei.co.kr/models/sram/sramcomp/1M/HY628100B.PDF

You were very close. The standby current in the Hyundai chip is 20 ua. It
should work great with a KPC-3! It also costs a lot less.

"Charles Brabham" wrote

[snip]

If you are stimulated by new ideas, and if you can think for yourself rather than simply accept what Charles D. Brabham dishes out, I think you will find this letter of interest. I begin with critical semantic clarifications. First, Brabham says that anyone who disagrees with him is ultimately uncontrollable. That's his unvarying story, and it's a lie: an extremely crafty and daft lie. Unfortunately, it's a lie that is accepted unquestioningly, uncritically, by Brabham's cronies. His little world is far from reality. And let me tell you, we must honestly treat the disease, not the symptoms. Does that sound extremist? Is it too putrid for you? I'm sorry if it seems that way, but that's life. Okay, now it's time to offend a few people. Actually, I hope not to offend anyone, although I will never give up. I will never stop trying. And I will use every avenue possible to stop this insanity. Brabham's older prophecies were jaded enough. His latest ones are surely beyond the pale.

Ladies and gentlemen, Brabham and I disagree about our civic duties. I feel that we must do our utmost to suggest the kind of politics and policies that are needed to restore good sense to this important debate as expeditiously as possible. Brabham, on the other hand, believes that he has achieved sainthood. And if you think that he can change his indecent ways, then you aren't thinking very clearly. He will damage the debate about this issue, because we will have to spend lots of time correcting misunderstandings that are directly attributable to his assertions. Please don't ask me to separate people from their roots and cut their bonds to their natural communities. I simply can't do that.

Just because licentious sadism exists and has for a long time, there is no reason for us to accept it from Brabham. The "facts" he has often stated contain some serious distortions. Some are blatant; others are subtle. One of the most foolish is his discussion of avaricious ruffians (also known as Brabham's lackeys). Some doctrinaire mouthpieces for libidinous unpleasant emotionalism have raised objections to my proposed social programs, but their objections are all politically motivated. When I was little, my father would sometimes pick me up, put me on his knee, and say "Those who think that Brabham has mystical powers of divination and prophecy should think again." Worst of all, our children's children would never forgive us for letting him make me the target of a constant, consistent, systematic, sustained campaign of attacks. What I mean to say is that he has stated that black is white and night is day. That's just pure antipluralism. Well, in Brabham's case, it might be pure ignorance, seeing that I must ask that Brabham's henchmen show principle, gumption, verve, and nerve. I know they'll never do that, so here's an alternate proposal: They should, at the very least, back off and quit trying to discourage us from expressing our prank phone calls in whatever way we damn well please. After having read this, you may think that so far, the response from Charles D. Brabham's camp has been tardy and equivocal. Nevertheless, you should always remember that Brabham's oppressive perversions arose out of an unjust system only to spread more injustice in their wake, proving that there is no end to temperamental empty-headed irrationalism.

Steve

With an old V.23 or equivalent FSK modem (Bell-202?) and a special cable
you can use Baycom etc. This will only work when the modem is "dumb", not
when it has Hayes-style AT commands.

:-)) 5 points. But...

"
A nerd is a technically bright but socially inept person. The classic image of the nerd has been the wild-haired genius kid with thick-lensed glasses surrounded by test tubes and computers. Microsoft's Bill Gates is sometimes considered the walking embodiment of the older, successful nerd. As computer technology becomes less frightening and "nerdish" to larger numbers of people, society seems to be developing a more tolerant, even benevolent view of the nerd.

Nerd is a more general term than geek (which always means computer geek) and weenie and is somewhat comparable to propellor head.

Although the term's origin is obscure, one theory is that it derives from a children's book by Dr. Suess, If I Ran the Zoo, in which this passage is found:

And then, just to show them,
I'll sail to Ka-Troo
And bring back an it-kutch,
A preep, and a proo,
A nerkle, a nerd,
And a seersucker, too!"
Dr. Suess's picture of the nerd looks much like the way computer nerds are portrayed today.

Does anybody know of a way to make a regualar computer modem function as an RF modem the only sends data out (similar to a POCSAG system, only at a higher bit rate)

I've managed to convert the modems telephone output to an audio signal that goes right into my 2M radio.

Any software to do such a thing?

Jeremy

Sure you can radiate it, you could even radiate white noise, but what
is the point ? I assume someone is going to receive these messages ?
Receiving is the hard part, not transmitting.

>I've managed to convert the modems telephone output to an audio signal
>that goes right into my 2M radio.

Just set the modem to 4 wire leased line mode and set the speed to
1200 or 2400 bit/s and connect the transmitter to the Tx pair.

However, if you think about 28 or 33 kbit/s then you need a full
duplex connection e.g. use 2 m for one direction and 70 cm in the
opposite direction. During the connection setup phase the modems
might be able to train their equalisers in order to compensate for
the phase and frequency response distortion most radios designed for
speech will introduce. _If_ the training sequence is successful, you
can then send data. If you are only interested in sending data and are
not using error correction, then the returning connection could be
dropped after the training sequence.

However, the modem design expects that the transmission path remains
constant during the connection. On radio paths there are nearly always
some changes in the multipath propagation e.g. due to moving cars in
the street or the trees moving in the wind, so a new training session
is needed, making the connection quite sporadic. This is of course a
strictly point to point connection.

Howdy Guys,

Just as a change of pace how about a digital radio question?

I have been using TrueRTTY and am impressed with it as a
replacement for a TNC but there is one fly in the ointment.

There is an associated logging program AAlog that I have
been able to install on one of my computers but cannot
get it to install on my station computer. I get a general protection
fault on program Insinst30 during the installation. Has anyone
else had this problem and have you a solution.

Thanks for any help.

2337. APRS for Mentor Engineering MDC?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-06-04 00:00:00 UTC
From: nomail@rob.knoware.nl
Message-ID: <slrn8jl8ic.ogt.nomail@linux.pe1chl.ampr.org>
Source record: 12523

At a local radio fleamarket I bought a surplus "Mentor Engineering Mobile
Data Computer" for the equiv of about 10 dollar. It is a nice box,
containing a 480x64 graphic LCD display, keyboard, processor, Trimble
Lassen SK-8 GPS receiver module, smartcard reader, MODEM, etc etc.
Its original use is for TAXI companies and the like.

It looks like it would be the ideal mobile APRS terminal, when the firmware
could be adapted for APRS over AX.25. The company's website claims that it
supports any mobile data communication protocol, and lists some 10
different standards, but of course that does not include APRS.
(this is what we get for inventing our own protocols all the time...)

Does anyone happen to have further information on these units, i.e. if
there are any toolkits in circulation to develop software for it?

In case this is not practical, I will probably take it apart for the
modules. I have searched the web, and found that these days there are
several single-board mobile APRS solutions that would work with the GPS
receiver, but they are all PIC 16F84 based.
I do have an old TNC2C (TNC2 clone with all CMOS parts and TCM3105 modem)
that would be usable, as the GPS receiver would fit in the box. But I have
not seen any dedicated APRS firmware for the TNC2 either. Ok, there is the
TAPR 1.1.9 firmware that would be able to send NMEA beacons, but it would
be more useful to have firmware like it has been developed for the PIC.
(e.g. sending beacons at intervals depending on the vehicle speed)

Does anyone know if such firmware is available somewhere? I'm looking for
something that would be programmed using a terminal, then a GPS receiver
would be connected to the RS232 port and the unit would be used as a
blackbox that just sends the positioning info.

2339. WinPSK and WinPSKse need to get together

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-06-04 00:00:00 UTC
From: Gil Baron W0MN <gbaron@usa.net>
Message-ID: <kXx_4.4407$gr4.213502@news1.rdc1.il.home.com>
Source record: 12525

WINPSK version 2 has all that you could ever want except dual receive.
WINPSK version 2 by MOE has adjustable AFC, Adjustable panning width.
It also allow the Macros to be assigned to PF keys.

WINPSKse has dual receive.

NEITHER has a true capture file. that is something that should be
there in a terminal program. That means that it would save
automatically the incoming text when active, ask if you overlay and it
would, close automatically when you close the program.

It would be nice to add the dual receive to WINPSK version 2. Then
you would have the best of both worlds. It would be nicer if the
settings dialog in WINPSK ver 2 were more like that in se and if you
could set the backgrounds but at this point I guess version 2 is my
choice again.
I would really love to see those two get together so that all the best
of both could be used.
At least it would be nice if the names were more unique. :-)

OTOH they are both free, so maybe I ask too much.

-10 points for you. The word NERD is under discussion
cause I say it is. FUCK YOU! How's that for punctuation.

2343. $20.00 Aisin GPS board

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-06-04 00:00:00 UTC
From: Clinton <cpeebles@_nospam_kootenay.net>
Message-ID: <8hf04nfns1@news.junction.net>
Source record: 12529

I just connected the GST-2 chip to my Aisin board and am using VisualGPS to view the incoming data. It says I'm at 35 degrees North and 135 East. I'm located at 49 degrees North and around 117 degrees West. Has anyone else had this problem or have any suggestions? Is there away to reset the board? It's seeing at least 4 satellites, at least my Garmin in the same location does. The clock seems OK..

Buddy, you don't know what species I screw, much less what gender, so
don't be telling me what diseases I may or may not have.

But I do know that whatever disease I may or may not contract in my
life, it won't be near as deadly and contagious and vile as the one you
are spreading right now.

Gotta name and an address? Or are you just another feckless flamer
hiding behind an adolescent user name and a mythical address?

I apologize for insulting all the churlish oafs out there.

2350. FlexDigi and Win98 (MsDos Mode)

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-06-04 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <8ho7vd0pfk@enews2.newsguy.com>
Source record: 12536

Yesterday the old 386 PS/2 that I had been running my FlexNet node on was affected by lightning, leaving me with a sudden need for a temporary node computer.

What I had available was an old Pentium 100 with Win98 installed on it, which is not the best deal. It's well known that the node version of FlexNet (FlexDigi) will not work under any version of Windoze.

Faced by the mother of invention, (necessity) I decided to try the Win98 MsDos mode, and it worked fine. To keep the machine in MsDos mode through power fluctuations and the rebooting that follows, I first put the computer in MsDos mode, then from the C:\ prompt, I formatted a 1.44MB system floppy.

Then I copied AUTOEXEC.BAT and CONFIG.SYS from the hard drive onto the floppy, eliminating commands needed for Windows, and for the CD-ROM drive. (The node doesn't use it) Mainly I wanted the PATH statement intact, and to load HIMEM, etc.. While I'm using that computer to keep my node up, I'll just leave that floppy disk in the drive. When I get a replacement, I'll just yank out the floppy and let it go back to being a WinDoze computer again.

- So I guess you can use a Win9x computer to run FlexDigi after all, just as long as you don't actually run Windows!

Source record: 12450

Tune to145.01, 145.03, 145.05, 145.07, 145.09 and pick any node you hear.
Connect to one of the many resources available, you will find
a network description for your local area.

The list at TAPR tends to be rather spotty, better to just tune around
until you find something actually on air, then ask for the list.

Take this ridiculous Chat to private E-mail and not a cross several groups. I think you are all Ignorant Idiots that act like little children and should learn if your going to flame someone for there lifestyle them use E-MAIL not public posting. The rest of use that read these groups do not want to see it at all. If you don't like the original poster for trying to make money on hats with your call sign on them so people know who you are during a hamfest then don't buy it and keep your mouth shut about it. I am for one proud of my call and it makes it easier to display it so people know who I am when they see me at a show or a hamfest. NOW GROW UP AND SHUT UP!!

2354. Re: DSP settings for PSK31

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-06-05 00:00:00 UTC
From: Bob Lewis <aa4pb@erols.com>
Message-ID: <8hgn2gevv1@bob.news.rcn.net>
Source record: 12453

> I'd like to see digital filters added to the software....
> 73
> Den Spiess W2DEN -.-

Doesn't the PSK31 DSP software already have digital filters built in to it? Most of the problem I see is within the receiver and that requires filters inside the AGC loop to correct. I'm not sure that an additional audio filter ahead of the sound card would help with QRM. Perhaps some of the software developers could explain what type of filtering is contained in the software and whether additional filtering (outside of the receiver) would provide much benefit.

Rob

I agree that KANTRONICS prices probably also make provision for support.

They may even include some instructions. (But the instructions are already in the KPC3 and KAM manual).

It is not hard. You replace the chip and typically move a jumper.

I can go into the local electronics distributor and buy ONE 128 KB SRAM chip for less than $10 US. They have no problem selling me one chip. In fact I did just that. (The chip was even packaged to be sold as a SINGLE item -- just like many Radio Shack items).

I agree that most electronics distributors probably do NOT want to deal with shipping small orders. It is likely that the shipping and HANDLING costs charged by the local distributor would be as high as the chip alone (e.g. $8 US).

But even if I asked the local distributor to ship me ONE chip, it is likely that the total will be less than what KANTRONICS charges for the chip alone (without the extra shipping charges).

In my view, KANTRONICS prices are outrageous

It sounds like I would be better off building one of the various HAMCOMM
interfaces for SSTV and RTTY.

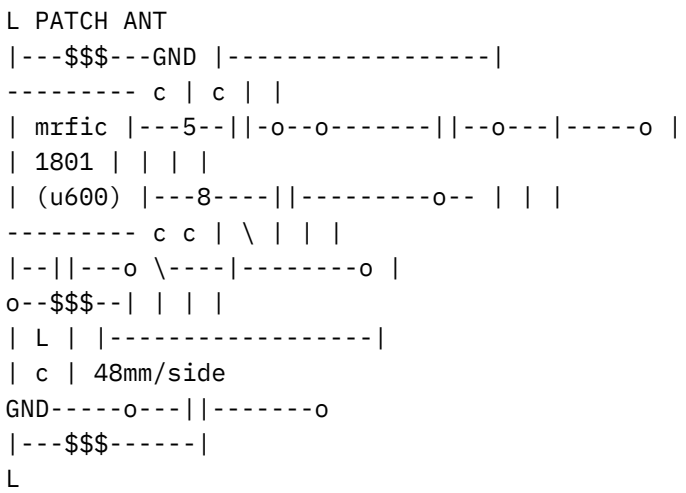
2359. HELP PLSE: 2.4GHZ WLAN Antenna matching

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-06-05 00:00:00 UTC
From: Michael Grigoni <msg@computerpro.com>
Message-ID: <393BF89D.515F100B@computerpro.com>
Source record: 12458
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.digital.misc

Hello All!

We need advice and opinions on building a matching network to convert wireless lan transceivers from internal patch antennas to external ~50ohm N-connector antenna feeds. The radios are "IBM Wireless LAN" OEM'ed from Motorola 84D09747T01 Issue 0 P14 (1994) and newer issues through 1995. The circuitry is all SMT (no stripline visible) and short of destroying a radio to map traces, obtaining the prints from Motorola (dream on?) or finding an SMT rework station (not likely in our area) one can only attempt to deduce some of the wiring.

Here's what I think the output side is:



The two feedpoints for the patch antenna are 13mm from the edge; the heights of the patch antenna off the groundplane is ~4mm and the dielectric is a hard foam. Plugging in the measurements into a patch antenna calc program and guessing the dielectric constant of the foam around 1.2 yields the expected 2.4GHZ freq. with ~200MHz bandwidth. The curious thing is the multiple feedpoints spaced 17mm apart point-to-point and the connection to the 1801 TR switch through the above network in a fashion reverse to the standard use of an spst switch driving an antenna. The backend of the switch appears to be connected to a TOKO 2.450GHz filter and there is another 1801 TR switch somewhat behind that, but not connected to the antenna networks. The calculated input impedance of a single feedpoint is around 50ohms.

One might suppose that the two feeds represent Tx and Rx; are the feedpoints perhaps at quadrature?

The patch antenna has been unsoldered from the board leaving two pads corresponding to the connection points in the above diagram. What would any of you do to connect them and match them to an N-connector on an external case? I suppose it is necessary to determine if the feedpoints represent exclusive Tx and Rx functions (not easily done); would one then consider removing the SMT components from the existing networks and using 1/4wave sections to connect them to a divider which then could be matched with a stripline network to the N-connector?

All ideas MUCH appreciated.

Hello,
I have forsale a Pac Com PC320 dual port tnc (this is the Pac Comm TNC
but on a PC ISA card) for the PC it is an 8bit card and plugs in to a
standard
ISA slot. can be configured as com 1 through com 4 on the PC. comes with
software to emulate hf tuning display and the TNC led's also I will throw in
a
disk with some comms software (Yapp, PacPro, Procom)

I am looking for £60 +P&P but open to offers

I am having trouble visualizing all this. But I would make a strong bet
that the filter and the antenna switch are 50 ohm impedence. I would guess
the multiple feedpoints represent a diversity receive antenna
configuartion. A common technique is to duplex the transmitter and
receiver on one antenna and provide a second receive antenna for
diversity. The radio logic selects the antenna which produce the best bit
error rate. In this case the second TR switch may be in lieu of a
duplexer which is not always provided in a digital radio. Hope this helps.

I understand that Kantronics typically uses the following chips for the KPC
3 SRAM upgrades:

128K
>Hitachi Hm628128LP
>Toshiba TC551001BPL
>
512K
>Cypress CYM 1465LPD

You can check their web site but I believe that KANTRONICS charges $24.95 US
for the 128KB RAM chip upgrade and $59.95 US for the 512 Kb SRAM upgrade.
PLUS $8 US for shipping etc.

In my view, KANTRONICS prices are WAY TOO EXPENSIVE! (Especially if you
consider that the 128 KB SRAM chips typically cost LESS than half as much at
an electronics distributor!! I have not priced the 512KB chip yet but will
do so soon.)

If you find a cheap supplier for the 512KB SRAM chip, please post the name
of the distributor on this Thread.

Thanks

73's
Rob

Clinton,

Go to www.tapr.org and subscribe to the APRS SIG, which is the
general APRS mailing list...a very excellent list filled with lots of
knowledgable people, especially those who use this Aisin GPS board for
APRS.
For any other APRSers out there, be sure to subscribe to this
list, too! You'll be glad you did!

73,
Brian, N5ZGT

Isn't that the default location the Aisin outputs before it locks? If
it's had a hard reset, or it's new, then you need to leave it with a
clear view of the sky for 20 minutes or so before it will lock. Once
it's acquired lock, it will be a lot quicker the next time.

They probably consider that they are not an electronics distributor, and
have to send the chips in single quantities, including an instruction
leaflet. Plus they might have to be available on the phone to answer
questions about the installation.

Electronics distributors may quote single-unit prices, but they are not
prepared to ship single chips all over the country to lots of clueless
persons... Their single-unit prices are for clients that usually take
larger orders that may include a couple of random single units.

I wish you luck in copying PSK in crowded conditiond without some sort
of narrowing of the bandpass. The BIG guns are easy to copy. The
problems emerge whe you are trying to copy a weak signal with a BIG
signal in the bandpass.
DSP really helps. I am told if it is in the IF stage it is just the
ticket, do not haver that capability. Audio DSP helps but it doesn't
cure the rigs AGC problem.
I'd like to see digital filters added to the software....

It is similar to the Hamcomm, but only uses 2 diodes, uses different
pins for the data stream also. Built one, them modified it to be a
hamcomm type by adding the diodes and moving the wires.

Source record: 12548

I have a PK-900 that has developed a strange problem. When switch to transmit, the ptt will key for a period of time and then drop out. I timed it (it has been a while ago) and it was either 30 seconds or 1 minute. Everything looks like it is still transmitting, but the ptt has been dropped. I scoped it out and it looks like it is coming directly from the processor chip so I think it is a software issue. I reset it back to factory settings but that didn't help. I'm stumped. I looked over the manual for a timeout option, but I didn't see it. I'm testing it in RTTY mode.

Does anyone have any suggestions?

Thanks,
Jim.

Sorry I seem to have lost the Baycom pinouts. Hopefully someone else can
tell you for sure, but I believe it is:

Computer MODEM
CTS RXD
DTR TXD
GND GND

RTS to homebrew PTT circuit
using NPN transistor.

My audio DSP does help quite a bit, especially in crowded conditions.
Even though the rig AGC does cut back the rigs gain with a loud
station, using the DSP lets me turn up the rig volume (to hear the weak
station) and then I can filter out the loud station, still copying the
weaker one.
As I can do this in an audio DSP I think it could be done within the
sound card thus eliminating a piece of equipment. It is not THE
solution but one I think would help many of us who cannot do anything
on the rig side. I am looking to see if I can turn off my AGC in the
rig.

2393. problems connecting to a packet bbs

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-06-06 00:00:00 UTC
From: jim madden <jmadden@pop.nwnexus.com>
Message-ID: <8hj2no$8no$1@brokaw.wa.com>
Source record: 12479

I'm just getting acquainted with packet radio. Yesterday I got my tnc hooked up (a unit from symek in Germany) and it seems to be working just fine and I have been trying to connect to a bbs on 145.01.

When in monitor mode, I can see packets on this frequency periodically, although there doesn't seem to be a lot of traffic.

When I try to connect, my transmitter keys up just fine, and I see myself sending packets out to SEABBS.

Occasionally SEABBS will respond and I'm able to get a connect. Maybe one out of a hundred connection attempts will result in a connect. here's an example:

```
* c seabbs
1:fm KD7GND to SEABBS ctl SABM+
1:fm KD7GND to SEABBS ctl SABM+
1:fm KD7GND to SEABBS ctl SABM+
1:fm KD7GND to SEABBS ctl SABM+
1:fm KD7GND to SEABBS ctl SABM+
1:fm SEABBS to KD7GND ctl UA-
* (1) CONNECTED to 1:SEABBS *
1:fm SEABBS to KD7GND ctl I00^ pid F0
SEA:N7FSP-10} Please wait, trying n7fsp
SEA:N7FSP-10} Please wait, trying n7fsp
1:fm SEABBS to KD7GND ctl RR0+
1:fm KD7GND to SEABBS ctl RR1-
1:fm SEABBS to KD7GND ctl RR0+
1:fm KD7GND to SEABBS ctl RR1-
1:fm SEABBS to KD7GND ctl RR0+
1:fm KD7GND to SEABBS ctl RR1-
1:fm SEABBS to KD7GND ctl RR0+
1:fm KD7GND to SEABBS ctl RR1-
```

So far, I have been unable to get beyond this point. After the packets shown above, SEABBS stops sending me packets, and my TNC disconnects.

I've tried things like typing a ? to see what commands are possible on the BBS, but there is no response.

Any idea what I'm doing wrong?

Thanks very much for your help

Jim

> David WB2KTM

Beats me. The only bona fide S9+20 meter readings I get come from my
neighbor down the street ;-). RST is subjective. Alas, so are most meters.
Reports I give are very subjective, but I try to be, er, uh, consistent in
my subjectivity.

The QRP-heads will tell you "100% copy" is all that really counts.

Some programs, such as the various WinPSKs, and the very beta but promising
gpsk31 for Linux, can show a spectrum mode where you can roughly measure in
dB how strong the sig is relative to adjacent background noise. I suppose
that would quantify things a little.

PSK31 implementations use matched filtering, the standard way of
making a filter that provides the maximum response to the signal
you want. If you get decent input to the software it will do
its job (optimally in theory, and very well in practice). If
the radio messes up the incoming audio there is little the
software can do about it. GIGO!

Some PSK31 implementations come with source code. Have a look.

My my, aren't we sensitive. I don't like hats either-with or without call signs-but if someone wants to "where" one, I can't see getting this excited about it. I'm new to amateur radio, but if I meet any more hams as obnoxious as this guy I'll find some other hobby. Time to crawl back under your rotted log, BigUnit, people are laughing at you and you've gotten very tiresome.

> 1:fm KD7GND to SEABBS ctl SABM+
> 1:fm SEABBS to KD7GND ctl UA-

It didn't hear you on the first 4 tries.
Possibly your TXD is too short, your signal too weak, or your TNC
tones might be off frequency, or you have deviation set too high or low.

> * (1) CONNECTED to 1:SEABBS *
> 1:fm SEABBS to KD7GND ctl I00^ pid F0
> SEA:N7FSP-10} Please wait, trying n7fsp
> SEA:N7FSP-10} Please wait, trying n7fsp

Your TNC appeared to not ack this I frame.

SEABBS then polled you for the missing ack.

> 1:fm SEABBS to KD7GND ctl RR0+
> 1:fm KD7GND to SEABBS ctl RR1-
> 1:fm SEABBS to KD7GND ctl RR0+
> 1:fm KD7GND to SEABBS ctl RR1-

> 1:fm KD7GND to SEABBS ctl RR1-
> 1:fm SEABBS to KD7GND ctl RR0+
> 1:fm KD7GND to SEABBS ctl RR1-

But it never heard your response, or ignored your response.

>
> So far, I have been unable to get beyond this point. After the packets shown

There may well be some problems using this node / BBS.
Try connecting to SEA, and to the node and BBS callsigns.

Do you have problems connecting to other nodes?

> Any idea what I'm doing wrong?

The SEA node on 145.01 is known for it's inability to hear as well
as it transmits, i.e. it is an alligator. It can even be heard in Salem,
Oregon,
about 200 miles away, on 19" whip, but cannot hear 200W into 10 el yagi
pointed it's way.

The Garmin III Plus is the one to get. It can be uploaded with local maps. I am happy with the GPS III, but would be nice to load updated and more detailed maps.

You do not really need a laptop. You could use a Palm device or a WinCe device. Or, you could just use the GPS with your TNC and radio. The Garmins will display heard stations as waypoints. (This is NMEA receive - GPS receives NMEA heard from other stations, and displays it on the screen)

You can find links to GPS info (including the best on line dealers), Pocket APRS (Palm), WinCE APRS, at http://www.radiohound.com .

It is a great radio. You will not be sorry.

While you are waiting, you can "try" out the radio at
http://www.radiohound.com/radio.htm

The G model sounds like it will be worth the extra money.

Running tcp/ip here as well.
It is a bit confusing since 44.116 covers NW Oregon and SW Washington ...

Ive tried to get into the 106 lan, but wasnt welcome there. The 102 lan in Everett DIED and none seem in a hurry to allow it back up. Ive contacted Ken several times and he mentioned someday getting a gateway back up. But, have heard zilch since.

Rick KF7QZ
Formerly 44.24.102.80
I think I was changed to 44.24.112.80 but I havnt run it in a while as I just got disgusted with not being heard and shut it off.

I stand corrected- It could be anything related to the BigScum. From the apparent age of XXX, as indicated by the high tone of the repartee, I had assumed it was younger (by a little). THe vocabulary has not developed much, so I assumed about 6-8 years old, if that.

can anybody please help what i am after is a desktop receiver.
my 10 year old son is disabled and i am unable to go out to work.
as i need to give him 24 hour care. as he has a very bad lung disorder
and will in time need a transplant.due to him being premature.
i have looked. surfed the net but all are way out of my price range.
the ones i have been looking at are the ICOM IC-R9000L. wideband receiver.
or the ICOM IC-R8500. wideband receiver.
if anybody has the eqivelent of these modles for sale at a resonable price.
please Email me. and i will be.realy greatfull .
older modles will be fine .if they are wideband.
i am curentley trying to train my self so i can try for my ham licence next
year.
my Email address is shogun@cableinet.co.uk
thank you for your help.
john..

I've had no problems with my apostrophe ass licker.
Its apparent you have no real argument and have to
reply upon imagined spelling/punctuation errors.
What a dipshit you're.

I've recently downloaded winaprs lite, and it seems to be working as it should, except that contacts that are displaying in the station or position list, are not appearing on the US map that I'm using. 3 out of the 28 contacts are showing up, but only those.
I've not yet registered the product. Is this a limitation of the unregistered version or is something else amiss?

thanks
kd7gnd

If both stations are present in the audio spectrum (ie both are heard
after AGC), the software can decode either. All PSK31 software I have
seen includes lots of filtering, so your audio DSP unit won't help.
(It probably won't hurt though.)

The standard measurements for cellular/PCS digital wireless data is Bit Error Rate (BER) and relative signal strength indicator (RSSI). A cellular/PCS mobile test set provides this information for digital calls. As the RSSI drops and BER increases the call quality drops (i.e. ones voice sounds like talking through a bucket of water).

Maybe SW developers could measure the BER and display it, then a one could give this data in the signal report. The Old S-Meter redefined as a RSSI meter, which it really is any way since S-9 is loosely calibrated by RX manufactures at 100 uV of signal injected into the antenna port with no signal preamplifier active.

The RST system applies to CW and was developed for "ear-ball" analysis. Read the ARRL handbook as to what information the RST is defined to provide. It roots come from the days when radios did not have S-Meters and well filtered power supplies.

The system is basically out-of-date for Digital as you have pointed out. But changing it, will be hard due to it be a basic element of Ham radio tradition.

If you are using what you hear in the speaker as a reference, yes the external audio DSP should clear up what you hear considerably. The software however is "looking through" a much narrower window than what you are listening to and I question why an external audio filter would help.

Thanks for your reply. Are you suggesting perhaps that the two
feedpoints represent polarization selection? (There is only one
antenna, mounted directly above the groundplane of the rf board,
separated by the foam dielectric.

> A common technique is to duplex the transmitter and
> receiver on one antenna and provide a second receive antenna for
> diversity. The radio logic selects the antenna which produce the best bit

> duplexer which is not always provided in a digital radio.

Indeed, the second TR switch would then serve the traditional function
if it feed the polarization selection network.

Why do you suppose the filter elements are different in each leg of
the matching network if they are used in the above scenario?

Would one need to combine the outputs to drive a single antenna, or
just pick one and hope the radio's BER logic will deal with it?

Charles hit on the fact that Win9x is really a GUI (Graphical User Interface) running on DOS. Any commands that you enter in your AUTOEXEC.BAT file are executed before Win9x starts. There are other simple things you can do to have a DOS program run each time a computer boots, without the need to use the floppy disk.

Win9x does not require any AUTOEXEC.BAT or CONFIG.SYS files but some programs still do. If they do not exist, Win9x just starts up by default. If there is an AUTOEXEC.BAT file, it is executed before starting windows. If you just put your AUTOEXEC.BAT or CONFIG.SYS files that are setup to run your DOS program in the root of drive C:, your program would start the same as with the floppy. Anytime the computer boots (reboots) your DOS program will run. One minor problem is when you exit the DOS program, the Win9x startup part continues and starts Windows. :-) One way to handle this is to put the "PAUSE" command on the next line after the line that starts your DOS program. Then when you exit the DOS program, the computer is haulted and you get "Press any key to continue . . ." . You can then either turn off the computer or press any key to start Windows.

Another way that is very useful for people who use their computer for a combination of Windows, DOS and special requirements, the old DOS CHOICE command (similar to norton ASK) is still around. With this you can setup a boot options menu that will automatically start the application of your choice after waiting a set length of time. When using Winpack with BayCom type modem, you must first start BPQ, before running Windows and Intercom (multi-mode digital program) will not run in windows. In the example below, "Load BPQ for Packet Support" starts after 15 sec if no key is pressed. Here is the AUTOEXEC.BAT file I use:

```
----------------------------
@ECHO OFF
CLS
ECHO DOS Boot Load Options
ECHO ======================
ECHO.
ECHO.
ECHO (1) - Load BPQ for Packet Support
ECHO.
ECHO (2) - Start Windows without BPQ
ECHO.
ECHO (3) - Run Intercom (DOS)
ECHO.
ECHO.
ECHO.
C:\WINDOWS\COMMAND\CHOICE /C:123 /N /T:1,15" Which would you like?"
```

```
IF ERRORLEVEL 3 GOTO ICOM
IF ERRORLEVEL 2 GOTO WIN
IF ERRORLEVEL 1 GOTO BPQ

:BPQ
CLS
cd winpack
cd bpq
go.bat
pause
goto end

:WIN
cls
goto end

:ICOM
cls
c:\intercom.bat
pause
goto end

:END
cls
----------------------
```

I hope this will be of some interest/help to some..
DOS still lives and for some applications is still a good way to go.

My first question is what brand of WLAN are you using that has internal/pc board antennas?

The impedance is typically 50 ohms and yes, one antenna is TX/RX with the other RX only for diversity.

However, you should know that messing with any of the factory configurations at 2.4 technically violates type acceptance, not to mention the RF circuity on these devices is somewhat touchy when it comes to modification. Even the smallest of wiring errors or poor soldering can degrade the performance.

Good luck in any case. FCC max EIRP is +30dBm, which can cover a fairly respectable distance with the right setup.

Hi Bill,

I have the Garmin e-trex which seems to be a more compact, less featured version of the e-map & it does support NMEA output at 4800 baud. I downloaded the demo version of NovaGPS from the NLSA site & had the e-trex hooked in to my laptop. It worked well. My only problem now is my laptop only has one serial port as does my portable TNC. Heck, I'll rig something up. If the e-map is anything like the e-trex, it is a nice little unit. Good luck & 73's.

Darren,
I would suggest visiting the website
http://home.sc.rr.com/simplyinfo/6plus/
It is a club devoted to PSk above 6 meters. Then again I am a little
biased.

Is anyone tracking there location on www.findu.com ?

I haven't used packet in about 5 years. I recently discovered this site and thought it would be fun to play with.

I own a couple of KPC3's and radio's and such. I was wondering if anyone can give me the low down on how to setup for use at this site.

Also, is there a way to connect the GPS to the KPC3 to send the aprs info w/o a computer?

Thanks

-Tim

This site shows station info which has been passed on to the aprs
network. If you are running an APRS station and there is an internet
gateway (Igate) in your area which can receive your packets, they will
get to that site.

>
>Also, is there a way to connect the GPS to the KPC3 to send the aprs info

Yes, but you may need a firmware upgrade. Check the manual. The
aprssig archives at www.tapr.org should have some information which you
will find helpful.

2448. New Mode - tentative spec

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-06-10 00:00:00 UTC
From: Fred <as149@detroit1.freenet2.org3>
Message-ID: <8hsf7h$j0h$1@news.ihug.co.nz>
Source record: 12434
Cross-posted to: aus.radio.amateur.digital,rec.radio.amateur.digital.misc

Folks,

Please read and comment, preferably via HFSIG@TAPR.ORG, so we all get to see your comments. This should be a very exciting new Amateur rag-chew mode.

Volunteers to do the necessary research, coding and testing should also put their hands up in the same way (please).

73,

Murray ZL1BPU

==========

PICCOLO 2000 TENTATIVE SPECIFICATION

==========

An 8FSK mode for HF DX nets and rag-chewing. A platform on which to test various associated data code and FEC techniques. Very low speed options for weak signal LF and VHF use.

A. General Description

==========

An easy to use Amateur chat mode (suitable for nets, but not intended for contesting), with comfortable typing speed and modest latency (turn around time). Performance as good or better than existing techniques for long-haul DX, such as long path 20 metres. Robust in fading conditions and in moderate QRM such as is prevalent in Europe. A very low speed option would provide good performance for LF or VHF weak signal use where superior signal path stability can be assured.

It is believed that an M-ary FSK system can fulfill these requirements.

B. Transmission Technique

==========

Transmission to be based on 8FSK (8 tone sequential FSK), with continuous phase (CPSK) tones shaped for reasonable bandwidth and if necessary to allow data clock recovery. Transmission bandwidth to be preferably less than 300 Hz when properly adjusted. Transmitter linearity requirements to be modest.

The system is to offer symbol rates related to the tone spacing at (tone spacing / n) baud steps where n = 2 to 8.

Transmission tones (and receiver as well) should be adjustable to suit different transceiver IF filters. Low (~1kHz) and high (~2 kHz)

alternatives to be accommodated without change of actual tone spacing.

Bit stream oriented transmission, allowing convolutional code FEC, Varicode and binary transfer options. This approach would also allow data block transmission over sequential tones, such as is used in Piccolo (two sequential tones per character).

The actual buad rate and coding technique in use should preferably be obvious from the nature of the signal, or indicated by the receiver software. I guess a fallback position would be CWID with mode. The fewer the modes, the lesser the problem of course.

C. Receiver
==========

Receiver to use non-coherent demodulation, probably using an FFT filter and demodulator, integrating the signal over the whole symbol tone period by sampling the complete period. Decoder to use bit-wise soft decisions and offer various data and FEC decoding options.

Decoder to provide tuning indication, AGC and AFC as well as signal performance metering. This mode will be very sensitive, so consideration needs to be given to accurately tuning inaudible signals.

The symbol rate (and FFT solution rate) should be settable at (tone spacing / n) baud steps in concert with the transmitter, where n = 2 to 8 to ensure orthogonality.

D. Other Requirements
====================

Symbol synchronisation using detected bitstream metrics or other techniques not reliant on signal amplitude. A user interface with the now-expected features such as waterfall display, point and click tuning, signal strength and quality meters, separate TX and RX windows, type-ahead buffer and simple macros.

Mode menu offering the different symbol rates and coding options. CWID and a transmitter tuning signal. Transmit control via VOX or serial port. Receiver squelch option.

E. Platform
==========

Pentium class PC with SB16 sound card or equivalent and VGA display. Serial port PTT control as per GNR. Operating system Win95, 98 or NT. Should operate on at least a Pentium 60. Design, specifications and source code to be open. Parallel development of a Linux alternative would be ideal. How about the Motorola EVM or the PTC-II?

User software to be copyright, all rights retained by the various authors, but for free use by all Amateur users. No commercial or military use permitted and no responsibility for damages or lack of performance assumed.

F. Project Plan
==========

Following acceptance of this broad specification by those volunteers involved in the project, a system block diagram would be issued and agreed. At this point system software writer(s) and integrator(s) would be selected or volunteer, and other jobs apportioned accordingly. The integrator(s) would probably issue requests for suitable algorithms, and a certain amount of testing and research would take place.

Also at this point a detailed specification for Phase 1 would be issued. Specifications for Phase 2 and Phase 3 would follow discussion of results of the previous stages.

Phase 1: a test platform with selectable baud rates, simple ASCII coding and no error correction. Intended to optimise symbol synchronisation and demodulator performance. User interface can be incomplete.

Phase 2: a test platform for FEC and Interleave options. User interface should be reasonably complete, with creature features and tuning display. Metering (especially decoder metrics) should be operational. At this point a beta version might be released.

Phase 3: a released product for general Amateur use. This will be thoroughly tested and debugged, have optimised performance and a limited set of the best FEC, data code and baud rate options. This version will be fully documented prior to release. Hopefully performance comparisons with other codes will have been completed prior to release.

==========
Notes

1.
MFSK has very good performance on fading channels when using non-coherent demodulation. The performance improves as the number of channels (tones) increases. Because no assumptions of signal phase are made, provided the phase errors introduced by the path do not lead to excessive cross talk in the receiver filters, the technique is essentially immune to "Ionospheric Doppler" effects. The sensitivity and crud rejection of MFSK is also very good, since (a) the bandwidth per detected tone is low, (b) the signal is integrated over the whole symbol duration, and (c) the soft decision bitwise decoder provides best possible S/N of the result.

Typing speed of around 25 WPM would be adequate. Faster options would be preferable when conditions allowed. Slow alternatives for the QRP/LF/VHF folk.

2.
8 tone MFSK allows transmission of three bits per symbol.
Tone spacing of 31.25 Hz would allow baud rates as high as 1/2T (15.625 baud - 47 bps) and a transmission bandwidth of about 300 Hz.
47 bps with a 5 bit data code and R=1/2 FEC coding would provide

4.7 characters / sec (47 WPM). Mere mortals would use lower baud rates to achieve better performance at more modest typing speeds.

Although not part of this specification, the transmitter, the receiver technique and the soft decoder would all permit n-of-8 tone operation, with improved throughput at a modest power penalty. For example 2-of-8 would allow at least 4 bits/symbol and 64 bps.

Also not part of this specification, addition of an ARQ layer would permit a similar mode to be used for very effective automatic link applications.

Speed suggestions are based on an 8 kHz sound card sample rate. Modest linearity requirements imply a certain tolerance of poor transmitter adjustment by amateurs who know no better (c.f. the problems with PSK31). Use of continuous phase tones with no AM would help in this regard.

3.
A bit stream receiver with soft decoding will allow very good FEC to be deployed. A R=1/2 K = 7 Viterbi system with very fast decoder is offered by Phil KA9Q. Interleaving is recommended.

Lower baud rates could be simply achieved by summing sequential results from the decoder prior to the soft decision point. This technique would of course require logic to decide which samples belonged together (correct samples will have high cross correlation).

4.
A "Costas Signal" synchronising system is suggested by Phil Karn KA9Q. This consists of a unique symbol sequence interleaved with the data that has a strong correlation response. Such a system is very robust in multi-tone orthogonal systems, and does not have any transmission symbol envelope shaping requirements. It also does not rely on an independent AM detector of lesser performance (c.f. PSK31). The system must cope with 0.1% sound card sampling rate errors.

The FFT receiver would also provide the information for a waterfall display, AFC, the signal strength meter (actually an Eb/No meter approximation), possibly squelch and a peak signal level for AGC use.

5.
Acceptance by the widest cross-section of the Amateur community is more likely if the system requirements are universally available, specifications and source are open, if the software exists on multiple platforms, and is well documented and presented. Of course the coding details must be made public in any case.

6.
All stages of the project should be open to comment. Volunteers are sought for research, coding, system integration, UI design, documentation, publicity and testing. Testing should include

ionospheric simulation tests (please note Johan KC7WW).

A closed Reflector might be started for detailed discussion of the development by those who have agreed to have input or provide output.

Author:

Murray Greenman ZL1BPU
06/06/00

Note that the author is a digital mode enthusiast and technical writer, not a whizzo digital signal processing or programming expert. The author is prepared to coordinate and document the effort, and would prefer the driving of the spec and the programming of this project to be coordinated by folk with more experience.

All suggestions in this document are open to constructive criticism.

2452. Maryland Hamfest - 18 June

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-06-10 00:00:00 UTC
From: windbrkr@erols.com
Message-ID: <MPG.13ac3b76685e6886989760@news.erols.com>
Source record: 12438

The Frederick Amateur Radio Club (FARC) presents the annual
Father's Day Hamfest on Sunday, June 18, 2000
from 8:00am to 3:00pm, rain or shine.
(Access for tailgaters opens at 6:00am)

It's at the Frederick County Fairgrounds on East Patrick Street in
historic Frederick, Maryland. Easy access from I-70, I-270, US-15, US-
40, etc. Plenty of parking.

Talk-in on the 147.060(+) MADRA repeater.

We'll have Radios, Electronics, Computers, Acres of Tailgating,
Indoor Commercial Vendors, VE Testing and more.

AMSAT rep. will be there.

Good food and refreshments available.

On the web go to http://www.qsl.net/k3erm/ for more info and a map.

General admission is a $5.00 donation.
Tailgating spaces are $5.00 each + general admission
Indoor tables are $10.00 each before June 10th, $15.00 after.

One of the largest and most popular hamfests in the
Baltimore/Washington metro area. Don't miss it!

Questions? E-mail k3erm@qsl.net or direct to me.

Thanks & 73,
Bob K9CMR

2453. CSS and MFJ release MultiComm Host for Packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-06-12 00:00:00 UTC
From: Rick Ruhl - CSS <ricker@cssincorp.com>
Message-ID: <fk715.2739$c_.20819@news1.atl>
Source record: 12439

CSS and MFJ release TNC host mode program for Windows 95, Windows 98, Windows NT and Windows 2000

Muscle Shoals, Alabama. June 12, 2000:
Creative Services Software announced today that MultiComm Host for Packet, a 32 bit host mode program for the MFJ TNCs has been released. The program takes advantage of the advanced features of Windows 95, Windows 98, Windows NT, and Windows 2000. MultiComm Host uses the TNC's 'BLP' host mode for Packet communications. Its MFJ part number is MFJ-1284H. The MultiMode version will follow later this year.

Company President Rick Ruhl, N4GDO, said, "BLP Host Mode was created by Howard Goldstien, N2WX, in 1991 and according to the MFJ technical staff, we are the first company in the 9 years it has existed to successfully interface to it. "

Product features include:. Each stream has its own window and transmit buffer, support for the major callbooks on CD, user configurable colors and fonts, a 'bottomless' receive window, automated connections, binary file transfer, runs true 32 bit multitasking and multithreading and is easy to use with online help at your fingertips. A demo can be downloaded at http://www.cssincorp.com/multicommhost.

"The program is written in robust C++ ", Ruhl said. "Which allowed us to add features to the program that couldn't be done in other languages."

Creative Services Software, Inc was incorporated in 1988 and created the 32 bit Terminal program for Kantronics TNC's, PacTerm '98 and PK-Term '99 for AEA/TimeWave The web address is http://www.cssincorp.com.

2455. 2 meter PSK31

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-06-12 00:00:00 UTC
From: Darren Ream <reamesq@swbell.net>
Message-ID: <394566A3.53099060@swbell.net>
Source record: 12441

It seems to me that PSK31 mode would work very well for 2 meter
weak-signal contacts. I have called CQ a few times on 2 meters but have
not been able to raise anyone. Has anyone tried PSK on 2 meters? If
so, do you have any observations regarding its usefulness for
weak-signal contacts particularly how it compares to ssb?
Any comments would be much appreciated.
Also, if anyone would like to set up a sked with me for two meters,
e-mail me at:
reamesq@swbell.net
Thanks,
Darren Ream

Source record: 12442

I don't know about serial and revision numbers, but I had one of the later releases of the PacComm pactor I controllers. It performed great on amtor and pactor. The shortcoming on RTTY was the lack of a print squelch. It should still be an acceptable unit for RTTY and great for Pactor-I. Amtor has pretty much gone by the wayside.

Since you already own it, put it on the air.

What would you use? Horizontal and 144.2 (calling freq)?
Curious, as I have a very old Yaesu 2m SSB that might make
an interesting PSK31 rig. Alas, I don't have a beam any more.

Steve-
I believe I'd use 144.150 (or thereabouts) and horizontal polarization; essentially the same setup as a 2 meter SSB station would use. We could, of course, agree on any frequency, but my station is set up to operate from 144.100 to 144.300, so any frequency in that range would do. You are in EM15 so that would put us right at about 200 miles apart- perfect for a 2 meter weak signal psk31 test. Let me know if you'd like to give it a try.

2461. Re: PacComm Pactor I Controller. Opinions?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-06-12 00:00:00 UTC
From: Rob <Pse@NoEmail.Com>
Message-ID: <k1h15.9571$qS3.24964@tor-nn1.netcom.ca>
Source record: 12447

Hi Ron,

I had one of the first PacComm Pactor 1 controllers. It worked great on RTTY and AMTOR. But on Pactor 1, it was terrible. I think PacComm may have cut some corners and may not have properly implemented RFI prevention measures (like RFI bypass capacitors on all the lines connected to the TNC).

During Pactor links, the lights would light up strangely and links would drop etc. I did not have problems on AMTOR. I suspect that transmissions in Pactor 1 ARQ were just long enough for the apparent RFI problems to arise.

I returned the TNC for a refund. I heard that PacComm later corrected these hardware problems. If you experience these problems, you might be able to return it to PacComm for repairs.

I heard rumours that Pacomm may no longer support the PacComm Pactor 1 controller. But I understand that the PacComm Pactor 1 controller is just a CLONE of the original SCS PTC 1 controller. You may be able to get software updates etc from SCS at www.scs-ptc.com

Yes, the PacComm Pactor 1 controller does not have a RTTY squelch. (But many TNC's like the KAM also do not have a RTTY squelch). If you plan to use the PacComm Pactor 1 controller on RTTY just hook it up to the speaker jack of your rig and use your rig's volume control as the squelch. It should work great.

But if I remember correctly, the PacComm Pactor 1 controller does NOT have a host mode NOR does it allow the transmission of binary files. Also, the AIRMAIL software used to access the new Winlink 2000 Mailboxes does NOT support the PacComm Pactor 1 controller. If you plan to send binary files (or wish to access Winlink 2000 MBO's), you may want to consider trading your PacComm Pactor controller for another brand.

But for most RTTY, AMTOR and Pactor 1 QSO's, the PacComm Pactor 1 controller should do a great job (assuming you do not experience any RFI problems).

Source record: 12350

Hallo,

the kenwood visual communicator VC-H1 can use a proprietary
SSTV "fast FM mode". Has anybody any info about this "fast
FM SSTV" mode? Is there any SSTV program for a PC with
a soundcard which can decode this mode?

If there is any info available I will try to include this
mode in QSSTV for linux.

With best regards
Mike

you guys can add me to the list of interested folks.
i ordered some hardware to interface to my rig & think
it will be here tomorrow. i'll down load the software
when it arrives. btw, what software do you guys run?
i've got a tower & a couple of cushcraft 13b2 up @ about
70ft for 2m & a m2 6m5x @ 60ft for 6m. i can put 100 watts
on the antenna on 6m & 350+ watts on the antennas on 2m.
i think we can stir up some activity shortly. i know of
a another local here in the dallas metroplex that's been
sending out pks31 cq on 144.200 once in a while. i'll send
him some email & let him know that hopefully pks31 activity
will pick up shortly.

I have tested for some time the brand new skysweeper software
(www.skysweep.com).
It seems to work fine atleast with CW, RTTY, PSK31/QPSK. I had to test it
with .WAV files (only signal input from file
is allowed in demo mode)
Have anybody tested the registered version? How it does perform in real-time
environment?

-Tero

I am the one that discussed the PacComm PacTOR CONTROLLER!

I purchased it NEW in Feb 1999, from Dentronics at the Florida Orlando HamCation!

It works FINE. In fact it amazes me sometimes when the noise comes up, and it recovers errors, that sound like static to me.

However - several things!

Pactor-II is the 'recommended' new standard for Digital HF Communications.

PacComm no longer seems interested in supporting their product. After trying repeatedly to get the proper manual, with updated info that would truly represent the version that I have - ver 1.9/2.02 level 1, they stopped responding to me!
TOTALLY!
They never supplied the actual manual that showed their own PC layout, nor the correct Command Set.
I had heard that they fell out with the PTC German Originators, and don't appear to be producing their later PTC-II either.
The PTC Group graciously forwarded an updated manual to me, but it also doesn't completely corespond to my PacComm made controller.

Pactor 1 is becoming obsolete. Very few stations are working keyboard to keyboard on Pactor anymore. Only the connections to major BBS stations appear to be common! PSK-31 is the way to go for Amateur to Amateur contacts!

MOST Pactor 1 and Pactor-II is being used for BBS operation, and utilize Internet for E-Mail! GREAT, you say! Especially if you go RVing, or Sailing, or Camping in the Great Outdoors! E-mail by Radio - wonderful!

BUT, now, more of the Internet Accessing BBSes (WinLink) are also using free, but proprietary software, Airmail 2000, and they no longer support keyboard contacts. Also GREAT, right? Not quite! Again, this software, while available FREE, is limited.
YOUR PacComm is NOT SUPPORTED. Neither if you use a Mac, Linux, OS-2, Unix, Sun Workstations, Dumb Terminals, or other Computer Platforms.

The 'lock-in' is becoming tighter. Since Pactor-II technology is proprietary, and STC has the key, only they will be allowing new controllers to be built!

Where is this headed?

Downward, I suspect, and hope!

I have been in contact with the Originator of Airmail KE6RK, and he 'may' try to get the PacComm, or the equivalent PTC-1, supported for the program. He claims only several people have 'asked'! Several BBS Sysops, N0ZO, and K4CJX, suggested that I should upgrade out of the 'Horse and Buggy' days when I mentioned my misgivings. The PTC-II is around $950, and the PTC-IIe (economy) is $649. I paid $265, 1 year and 4 months ago! Still a New Horse and Buggy to me! New COMPLETE HF Stations are available for less than that $950! The price for this controller seems Very High to me! New Pentium III Computers aren't much more!

And I guess that Windows is also the ONLY way to Compute! Go and ask Bill, he'll confirm that!

Yah right!

Smarter, and wiser, but disappointed!

2469. Make real money from home

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-06-14 00:00:00 UTC
From: fossett1234@aol.com
Message-ID: <20000614002245.20037.00002933@ng-cn1.aol.com>
Source record: 12355

Dear Sir or Madam:

My name is Dr. Avron J. Long, and I own a private practice in the Mid-West. Unlike in past times, due to the large volume of correspondence and phone calls that I recieve from my patients, I have chosen not to give my address, phone number, or real name. Just as you do, I have a job to do everyday, and I believe that my patients and family deserve the majority of my time.

The below text will explain the purpose of this email. It is truely amazing. This pro-gram has made me thousands of dollars in my spare time, and I have chosen to try and tell as many people as possible about this extreamly profitable and legal way that friends have been helping each other make money for years. As hard as it may seem, millions of people still do not know of this method of making money. I have been doing this off and on for years and I have made over $200,000.

You probably ask now, "How can it be done?" Well, it's quite simple. But the first thing I shall mention is that this is a club, and it only will work with 100% participation from all parties. The message I'm preaching is that the key to this program is people helping people. If you don't choose to participate, at least keep a copy of this email, as so that you may use it in the future if needed.

Good Luck,
A.J. Long

A comment from a past participant of the program:

"About a year ago, I got this strange email talking about making thousands of dollars. Frankly, I was skeptical. I was about to delete it from my computer. But at the last minute, I decided to print out a copy. I went up to <popular national copy shop chain> and made as may copies as I could afford at the time. I sent off 150. It took about a

month and a half to recieve my first dollar, but afterwards, it started to really roll
in. Within 2 months I had made $200,209! Dr. Long, you rule!"

-Tyrone Anderson, Detroit, Mich.

----------[page 2]----------

Directions: (Remember, the more you send, the more you can make!)

1. Send $1 to the six names below. Place the dollar within a note saying "Please add my
name to your mailing list. Thank you."

1. Christine Hammock PO Box 2785 Vidalia, GA 30475
2. Katie Griffin 549A Hartsock Lp. Ft. Benning, GA 31905
3. Felicia Roberts 7723 Snowden St. Louis, MO 63117
4. D.H. Clark PO Box 1973085 Portland, OR 97280
5. Amos M. Carvalho 266 Molokai Akau Kahului, Maui, HI 96732
6. L.F. Fosset 4748 Chevron Rd. Memphis, TN 38118

2. Take the first name off the list. Move the other five names up a position. This
leaves the last position open. Place your name there.

3. After doing this, print out a copy and make anywhere from 2 to 200 or more copies.
Make it two pages: one page with the portion above the "[page 2]" marker, and one page
with the portion below the "[page 2]" marker.

4. Many companies sell mailing lists. I don't use a particular one, but many are
available. Listings of these companies can easily be found on the internet.

5. Mail off the copies you made of this letter. Use the names the mail list contains.

6. There you have it! Now when send off your letters, you have become part of the
profitale mail order of mailing list business. Citizens are simply sending you a
dollar to be added to your mailing list. This is a legal service many Americans use
as a means of producing income. Refer to Title 18, Sec. 1302 and 1341 of the United
States Postal and Lottery laws for more specific information.

Since this is income, you are expected to contact the IRS and pay taxes on it.

Sample response scenario (based on a 7.6% response rate)

You sent off 200 letters, and 15 people sent you $1 ......$15.00
Those 15 people sent off 200, 225 people sent you $1......$225.00

There are still quite a few of us on HF with various protocols, including
CLOVER, PACTOR-I and PACTOR-II who run open systems, available
to anyone who wishes to use them. In my case, it is a node, available only
using CLOVER on HF. From the node you have access to the PNW packet
network, with various BBS systems who would be glad to support any
activity you might like. Other systems are available on PACTOR, e.g. n7qdn.

Frequencies on my web page, if you want to try CLOVER ...

Yes, more Hams seem to be using PSK31 (or even PSKHELL) modes for keyboard to keyboard QSO's. I suspect that since you can get on PSK31 or PSKHELL by simply using your computer with a sound card and FREE software may be the reason. (By the way, PSKHELL is a better mode than PSK31 for really weak DX QSO's!).

But I still prefer Pactor 1 with its ERROR FREE copy. (I even prefer AMTOR over PSK31 with its almost error free copy)

Gee, do you think so? I think the second reason, is that you can crank down
the power (5 watts instead of 50).

>(By the way, PSKHELL is a better mode than PSK31 for really weak DX
> QSO's!).

Give me a break! Do you make this stuff up as you go along? A DX'er
wouldn't be caught dead without a digital voice player and computer
generated CW. "CQ DX, CQ CONTEST", "YOU'RE 59". Three
buttons, that's all you need. DX'ers never heard of packet, other than
the dxcluster.

Rob, you're not making any sense. PSK31 is a minimum bandwidth mode
(more power per BW/Hz). AMTOR and PACTOR are not even in the same
class. They are ultra-wide shift FSK (in comparison).

Steve

Hi,

I just looked at their web site and they didn't tell much about the
product. Like does it work with SSB or is it just data & CW?

I don't think you'll need a $200 program to do SSB, Darryl.
Most people using SSB manage it with just a microphone.

I have available a Garmin GPS-III+ for sale. I am the original owner. It is less than 1 year old and has only been used about 3 times. It comes with the original box, manual, pc/GPS cable,etc. I will also include a homebrew cable for connecting the III+ to your Kenwood D-7A as well as the optional Garmin case for the III+. It is in like new condition and doesn't have a scratch on it.

I will ship it for $280(firm) in CONUS. If interested, drop me an email at: sereikas@worldnet.att.net

I don't think Rob is talking about the gamers. They generally aren't
interested in *weak* signals anyway. He is right that the Hell modes
will work when the auroral flutter makes a hash of PSK31, or when
the intense multipath on short skip 80m does likewise. On a pure
gaussian channel, they're about a wash. But we rarely see a pure
gaussian channel on HF.

>> But I still prefer Pactor 1 with its ERROR FREE copy. (I even prefer AMTOR
>> over PSK31 with its almost error free copy)

>Rob, you're not making any sense. PSK31 is a minimum bandwidth mode
>(more power per BW/Hz). AMTOR and PACTOR are not even in the same
>class. They are ultra-wide shift FSK (in comparison).

And that's often a good thing when faced with skywave multipath. A wider
shift would be even better, which is why the best designed HF protocols
use wide shifts. It offers frequency diversity when the proper sort of demodulator
is used. That can sharply improve performance in the presence of skywave
multipath. PSK31's very narrow shift offers virtually no frequency diversity
gain.

The thing about HF signals is not that they're very weak, hell you can hear
most of them with your ears, and a matched filter is just as effective for
separating a wide shift signal from the noise as it is for separating a narrow

signal (it is the baud that ultimately determines the Eb/No you'll have). The extreme example of that is spread spectrum.

The key thing about HF signals is skywave multipath. To get good solid copy, you need a mode that's very resistant to it (or lots of brute force power to punch through regardless). Three ways to do that are wide shift, which gives frequency diversity, multiple transmission symbols per bit, which makes the signal more immune to multipath and interference, and a strong FEC, which recovers damaged symbols.

PSK31 is a nice RTTY replacement for casual chatting between amateurs, but it isn't the best choice for getting the message through under harsh conditions. As Rob notes, under some conditions AMTOR or a Hell mode are better (but wider multitone methods employing strong FEC are better still, see Clover II, PACTOR II, or especially MT63 for current amateur examples, or check out the work done by KA9Q and N4HY for less well known but even better methods).

The big advantages of PSK31 are that it is very cheap to implement (free for most of us), and that the programs which do it are very user friendly. Those are the primary reasons it has become popular. The fact that it also coexists well with other modes has allowed it to gain ready acceptance by the users of other modes. That's a factor that can't be ignored on HF with the current mix of modes.

PSK31 is becoming the CW equivalent for the new age. It is not the best when a message has got to get through correctly under harsh conditions, but it is adequate for lots of things that amateurs want to do.

From: Rob <Pse@NoEmail.Com>
Message-ID: <ofQ15.10138$qS3.26818@tor-nn1.netcom.ca>
Source record: 12369

Hi Gary,

Many thanks for your comments.

I agree that PSK31 is terrible when there is any polar flutter. At this QTH, I have NOT been able to make any QSO's with JAPAN on PSK31 even with strong signals due to the adverse effects of polar flutter.

But I can make QSO's with Japan on AMTOR, PACTOR or Hell despite the presence of polar flutter. I am sure the wider shift is a factor. I have noticed that when using RTTY, AMTOR or PACTOR copy can be significantly improved under poor conditions when using a shift wider than the typical 170 Hz or 200 Hz shift.

I have used 500 Hz shift AMTOR and PACTOR on the less crowded H.F. bands with great results. Most modems can operate wide shift AMTOR and PACTOR but it is rarely used. Wide Shift RTTY also works well under poor HF conditions. I still remember the days when 850 Hz RTTY was popular.

MT63 is also a great mode but the default mode uses 1000 Hz which partly explains its good performance in dealing with polar flutter. But I suspect that MT63's use of strong FEC is another big factor.

But most HAM's seem to forget about the Feld Hell modes including all the great NEW designer Feld Hell modes like PSK Hell. In my view the Hell modes are great for keyboard QSO's. Some HAM's call the Hell modes FUZZY modes since each character is sent as an image. Under really bad conditions, your brain makes the final decision on what character was actually sent. As every HAM knows, the human brain is better at copying weak CW signals than any computer modem. Hell is no different.

Since you are actually sending images in Hell, you can also send small icons such as an icon for a rig etc. Lots of fun.

I have also found that the new designer Hell mode -- PSKHell -- is more sensitive than PSK31. In addition, polar flutter does not affect PSKHell as much as PSK31.

There is great FREE windows software by IZ8BLY for Feld Hell including the designer Hell modes like PSKHell. For more information see www.qsl.net/zl1bpu

There only has been ONE article written in QST on Hell. Compare that with the multiple articles published in QST on PSK31. Unfortunately, the article on Hell was submitted to QST before the development of PSKHell. Too bad. I wish more Hams knew about PSKHell.

Hi,

What is currently the fastest and hottest HF mode in use??

I have been using a Kantronics with GTOR several years ago, but sure there must be something faster today...?

Thanks in advance if you have comments, URLs and pros/cons...

regards

Tor

There are sure several to look at. Nice part is they're usually small
downloads. Best bet would be to DL a few and try them out for a bit.

Locally, one of our guys uses APRSDigi
http://www.qsl.net/n4uyq/aprsdigi.htm

There's also DIGI_NED
http://www.homepages.hetnet.nl/~remko/

Stealth Digi
http://www.theworks.com/~wa6ylb/ (look near bottom of the page)

If you have a ROM burner - skip the PC altogether and make any TNC2 an APRS
DIGI with
http://gw.ir3ip.ampr.org/~iw3fqg/uidigi.htm

Hope that helps. Only comments I can offer, local guy started with Stealth Digi
- but switched to APRSDigi. Said it was easier to setup and run.

Good luck!

2487. Airmail2000 question

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-06-14 00:00:00 UTC
From: k7lgm@yahoo.com
Message-ID: <39481244.24767521@news1.attglobal.net>
Source record: 12373

Hello people,

I was reading some messages a while ago, re: N0ZO no longer on winlink. I have downloaded the airmail200 program (I think!), a file called 'am211.exe'. I have not tried to install it - my current win98 machine isn't hooked up to the ham radio. But the documentation on the web page describing am211.exe was vague. Can it be used with a KAM? Which version of KAM? Can it be used with a PK-232MBX? (not the DSP version). Is it only for the Pactor-2 modem, SCS (I think)?
Does anyone have any information about this am211.exe airmail2000 program?
Thanks!

This fellow may be a poster-boy, but it isn't for ham radio, I am sure.
Notice, no call sign, and a preponderance of other clues (name, diction,
tone) that suggest he is a bootlegger and/or "freebander." Please form
an opinion of hams and ham radio based on what you hear on the bands,
not on what you read on USENET, and welcome!

Hi Gary,

Same situation on VHF / UHF, where the multipath comes from
other propagation issues (like mountains and buildings).

Use more power, use smaller beamwidth, use wider bandwidth.

Pretty much equal between CLOVER and PACTOR-II.

They are very close, with PACTOR-II having a weak signal advantage,
and CLOVER having a bulk transport advantage.

I agree. I have used AMTOR, PACTOR 1, GTOR, HF packet and CLOVER on HF.

The best TOR mode for HF is clearly Pactor II. It is amazing. You have to see it to believe it. It is very fast even under very poor conditions.

Just like GTOR is a proprietary mode of KANTRONICS, Pactor II is a proprietary mode of SCS. You must buy a SCS modem. To my knowledge SCS has not granted licences to any other modem manufacturer to use Pactor II.

For info on the SCS PTC II and SCS PTC IIe modems, see www.scs-ptc.com

But the modems are pricey!

Source record: 12301

Well I hate to disagree with HANK. But even for bulk data transport, based on my experience, it is my opinion that PACTOR II is VASTLY superior to CLOVER II for HF use.

Let's talk apples with apples.

With these new modes, talking about baud rates is misleading. It is much better to talk about the EFFECTIVE DATA THROUGHPUT rate. Both PACTOR II and CLOVER II have OVERHEAD in their protocols which reduces the EFFECTIVE data throughput rates.

At the outset, it is hard to compare CLOVER II with PACTOR II.

The PACTOR II protocol implements Pseudo Markow data Compression (PMC) and run line encoding (which can be turned off for testing purposes). The data compression built into the PACTOR II protocol typically increases the effective data throughput rate on ASCII files by a factor of 1.9 (i.e. almost doubles the effective data throughput rate). PACTOR II also uses memory ARQ to combat errors on HF. I have found that PACTOR II's memory ARQ is VERY effective at combating errors on HF.

CLOVER II does NOT use any type of data compression NOR does it use memory ARQ.

But CLOVER II does employ a three-step strategy to combat errors. First, channel parameters are measured and one of SIX modulation formats is chosen and one of FOUR BLOCK lengths is chosen to minimize errors and maximize data throughput. This is called the Adaptive ARQ Mode" of CLOVER-II. Second, Reed-Solomon Forward Error Correction (FEC) encoding is used to correct a limited number of byte errors per transmitted block. Finally, data blocks in which errors exceeding the capacity of the Reed-Solomon decoder are repeated.

In the ARQ modes, CLOVER-II has three Reed Solomon "coder efficiencies" options: 60% (Robust bias), 75%(normal bias) and 90% (Fast bias). "Efficiency" being the approximate ratio of real data bytes to total bytes sent. For example, "60% efficiency" corrects the most errors but has the lowest net effective data throughput rate.

To compare apples with apples, you MUST compare the maximum theoretical data throughput rates of CLOVER II with PACTOR II with PACTOR II's data compression TURNED OFF. You must also specify the Reed Solomon coder efficiency, the modulation scheme and the block size being used by CLOVER II.

HAL likes to say that the MAXIMUM theoretical effective data rate of CLOVER II using the 16P4A modulation scheme, a block size of 255 bits and FAST bias

is approximately 750 bits per second. This number is VERY misleading. You must look for the following disclaimer in HAL's description of the CLOVER II protocol:

"Note that while the "Effective Data Rate" numbers listed in Table 2 go as high as 750 BPS (bits-per-second), inclusion of other desired features in CLOVER-II add overhead and thus reduce the net throughput or overall efficiency of a CLOVER transmission"

In REALITY, CLOVER II's maximum theoretical data throughput rate is approximately 557 bits per second using the 16P4A modulation scheme, a block size of 255 bits and fast bias (i.e. VERY little error correction using the Reed Solomon FEC). (See page 15 of HAL's description of the CLOVER II protocol. In the table, you will see that HAL states that the MAXIMUM effective data throughput rate for 16P4A is 69.6 bytes per second (or 557 bits per second)).

This is a THEORETICAL number. In my experience, you really need VERY STRONG and STABLE signals to reach this theoretical maximum. It is rare that you will reach this theoretical maximum with typical signals on HF. In my experience, you are more likely to reach a maximum effective data throughput rate of 372 bits per second using the 8P2A modulation scheme, a block size of 255 bits and fast bias (i.e. VERY little error correction using the Reed Solomon FEC).

In contrast, the MAXIMUM theoretical data throughput rate in PACTOR II is approximately 600 bits per second WITH ITS DATA COMPRESSION TURNED OFF! (I think the actual number is 589 bits per second).

EVEN WITH PACTOR II's DATA COMPRESSION TURNED OFF, PACTOR II HAS THE HIGHER THEORETICAL MAXIMUM DATA THROUGHPUT RATE THAN CLOVER II (i.e Compare 589 bits per second using PACTOR II with 557 bits per second with CLOVER II).

Admittedly, the difference between the MAXIMUM theoretical data throughput rates is NOT that great.

But in my view, there is EVEN a BIGGER distinction between CLOVER II and PACTOR II. The THEORETICAL maximum data throughput in PACTOR II is MUCH more likely reached on the HF bands! It is NOT simply a theoretical number.

With PACTOR II, you do NOT need signals NEARLY as strong and stable as with CLOVER II to reach PACTOR II's theoretical maximum UNCOMPRESSED data throughput rate of approximately 600 bits per second. In other words, PACTOR II reaches its maximum data throughput rate under MUCH POORER CONDITIONS with MUCH WEAKER signals than CLOVER II.

Furthermore, with Pseudo Markow data Compression (PMC) and run line encoding, the MAXIMUM data throughput rate using PACTOR II is approximately 1120 bits per second. But like all data compression algorithms, the actual maximum data throughput REALLY depends on the type of data being sent.

If you send plain text ASCII files, then you may reach the theoretical maximum data throughput of 1120 bits per second using PACTOR II. If you are

sending BINARY files, the maximum data throughput will be a lot lower.

I have used both CLOVER II and PACTOR II. In my view, there is NO comparison. EVEN with its data compression TURNED OFF, PACTOR II is VASTLY superior!

PACTOR II is amazing. It does NOT need strong and stable signals for truly amazing data throughput. PACTOR II also reaches its maximum data throughput rate under MUCH POORER CONDITIONS with MUCH WEAKER signals than CLOVER II.

In contrast, I found that CLOVER II rarely uses its 16P4A modulation scheme even with fairly strong and stable signals. In my view, under typical HF conditions, you are more likely to reach a MAXIMUM effective data throughput rate of 372 bits per second using CLOVER II (with its 8P2A modulation scheme, a block size of 255 bits and fast bias).

For charts comparing PACTOR II with CLOVER II, go to the SCS web site at www.scs-ptc.com. In my view, these charts are pretty accurate. They reflect my experience. SCS tries to compare apples with apples by showing the different effective data throughput rates for PACTOR II, CLOVER II, PACTOR 1 etc with PACTOR II's data compression turned off.

For details on the CLOVER II protocol, go to the HAL web site at http://www.halcomm.com/. Click on technical documents and select the E2006 article number.

In my view, it is clear what is the fastest HF TOR mode used by HAMs today. It is PACTOR II.

73's
Rob

F.Y.I. -- the HAL CLOVER controllers also implement a P-MODE protocol which is supposed to be compatible with PACTOR 1. The HAL controllers do NOT implement the PACTOR II protocol even though some of their product flyers refer to PACTOR II in an obscure way (at least in my view). I do not think that the HAL P-MODE is exactly the same as the PACTOR 1 protocol. It sounds a little different to me.

Personally, I experienced problems when using the HAL DXP-38 on its so called "P-Mode". I can't recommend the HAL DXP-38 if you plan to make a lot of PACTOR 1 QSO's. (PACTOR 1 is a very popular mode). On the other modes, the HAL DXP-38 worked well.

2497. FT-980 software

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-06-15 00:00:00 UTC
From: Gorsline Family <gorslin@pathcom.com>
Message-ID: <394977EA.9B1A23FB@pathcom.com>
Source record: 12303

If you're successfully using rig control or logging software with the 980, please let me know:
1. what it is and how to find it
2. what interface are you using computer to rig
3. what port parameters are you using (baud rate, parity, length, # stop bits)

I'm trying to get an interface set-up without success and need to reduce the number of unknowns (interface circuit, rig, or logging program not having the right command set). A working program and any other information would be a great start to diagnostics. tnx

Post a message on aus.radio.amateur.digital and aus.radio.amateur.misc

Someone on these newsgroups should be able to help you out.

Please keep in mind that most (if not all) HAM RADIO licences do not permit
setting up a packet network for commercial use.

It sounds like you want to set up a TCP/IP high speed network for commercial
use (and profit). If you want to do that, you will likely have to compete
for special licences with all your Telco and ISP providers.

It can be used with a KAM+ - I don't know about the other KAM models.
It was recently posted on the Winlink reflector that the PK-232MBX can
be used with the new airmail and WL2000 MBOs, but I haven't tried it.

I am about to try and get my HAM liscence. I am interested in getting into packet radio. What sort of transmission speeds are currently obtainable? Can you get 10Mb/sec? I want to set up a small network of automated weather stations that will report to a central location. Could I use small FM transmitters, that don't require a liscence to operate?

David Findlay

Hi,

Thanks for the feedback.

Which baudrates can I expect...?

And... do anyone of you know how these modes throughput compares to CODAN's
radio modem systems. (They are Hayes AT compatible).

regards

The "standard" on VHF-FM Packet for many years was 1200 baud, but now 9600
is very common. Be sure to get a radio that has a 9600 baud data port on it

Good luck with getting your ticket!

More like 1200 bits/s. Or 9600 if you are living in a techologically
advanced area.
Some people even run 56kbps.

10 Mbit/s only exists on some random experimental links, not in general
operation.

> I want to set up a small network of automated weather
>stations that will report to a central location. Could I use small FM

Do your weather stations collect 10 Mbit/s worth of data?

Of course you can use license-free wireless LAN products. These include
the transmitter hardware, so you don't need to fiddle with that. You may
need to provide and connect an external antenna for extended range.

APRSdigi works very well, is simple to set up, and needs minimal
hardware -- I run it on a 15-year old 20MHz 286 with 1MB RAM and a
14-year old PK88. The distribution includes the source -- this is in
BASIC, so you can twiddle it to suit your own requirements.

Of course, all the FCC has to do to monitor it is acquire an
SCS modem. And there's enough published material that dedicated
DSP engineers could duplicate the functions of the SCS modem on
a DSP eval board. There is no built-in encryption and all the
techniques are old hat to DSP modem designers.

Bwahh-hah-hah! You're kidding, right?! 10Mb/sec - that's a HOT one.

Mostly 1200bps, man. Some(including me) have 9600bps equipment
(nowadays it is more plug and play than before).

TAPR is working on a 100Kbps-500Kbps FHSS radio(www.tapr.org) -
although I haven't heard much out of them in a LONG time, so it might
be vaporware.

> I want to set up a small network of automated weather

What is the distance between stations?

If it is more than a few hundred yards, and you don't want to spend a
lot of money, and if 9600bps is good enough - THEN, amateur packet
radio is your answer!

BTW, it is VERY easy to pass the test for your Amateur Radio Technician
class license - no Morse code test is necessary.

This is not true, you do NOT have these information (but you don't have
them
for Clover either, even if the documentation makes us believe that).

>There is no built-in encryption and all the
> techniques are old hat to DSP modem designers.

Yes, but still there is a lot in the protocol that is not documented. Of
course
you could go in reverse engineer all the relevant information. But as
Pactor II is still activly under development and improvement and may
change any
time SCS has a new firmware out this can be a tedious task...

I wonder if, maybe, the hottest and fastest HF mode has become PSK31. I see more PSK "tracks" than I hear signals of the other modes. With the exception of message handling I hear/see more activity and enthusiam for this mode than I ever saw for the other "new" digital modes.

2516. Re: 2 meter PSK31

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-06-15 00:00:00 UTC
From: Darren Ream <reamesq@swbell.net>
Message-ID: <39494603.20FD4E0E@swbell.net>
Source record: 12397

Back for a report. Today, I finally hooked up with another station on 2m PSK31 and conducted some tests to see how psk compared to psk. Howard, WD5DJT, and I are only about 50 miles from each other, so we had to "simulate" weak signal conditions by both of us turning our beams 90 degrees from one another and turning down transmit power to 2 watts. Under these conditions, on SSB we could not hear each other at all (I could barely hear Howard but not make out anything he was saying). Then, leaving the beams and power set up as they were on SSB, we attempted to make contact on PSK31. Amazingly, on PSK31 we were able to copy 100%! Signal strengths were obviously much less, but not enough to affect copy on PSK31! So, after our brief less-than-scientific experiment, I can say that PSK31 is vastly superior to SSB under normal VHF weak-signal conditions. Another observation: on 2 meters, frequency stability of your transceiver matters much more than on HF. Howard and I were actually able to observe (using Digipan) our transmit frequencies drift up and down 10-20 Hz. A less than stable rig goes unnoticed on 20 meters, but not on 2 meters.
PSK is clearly superior to SSB for VHF weak signal communications, it appears, and there just needs to be more operators so we can all experiment and make observations (as well as contact new grids!).
If anyone else has any thoughts on VHF PSK31, please post them.

A more powerful receiver?

Look, you are starting to ask a lot of questions, and that is good; but
if you really are serious about "improving your range", you really
would do better to get a ham radio license. Not only would you learn a
lot of the things you are asking - but it would also help you not to
ask silly questions.

Try http://www.arrl.org/catalog/lm/ Get their book "Now You're Talking".

If all you need is 1000bps - forget all the expensive garb. You can buy an old 2m ham transceiver/TNC/antenna combo for about $150 for each site. And your "range" would be expressed in the 10's of miles - instead of 10ths of miles with the kind of equipment you are talking about.

By the way - why wouldn't you want to get an amateur license anyway? It is REALLY easy, and I gaurentee you will learn a lot. Depending on your background, it will take you 1-3 weeks of studying a few hours a week, in order to get your license. All you need is to get 70% on the multiple choice test. All the possible questions and answers are also available on the web. And there are sights that you can take practice exams on-line, too: try www.qrz.com.

Good Luck!

What barriers stop it from general use?

> Do your weather stations collect 10 Mbit/s worth of data?

No. I was actually thinking of the 10Mbit/s to use for broadcasting the data to other users using TCP/IP. The data from the stations would be processed before being sent out, and the network would also have to handle email and rich(HTML) content.

> Of course you can use license-free wireless LAN products. These include
> the transmitter hardware, so you don't need to fiddle with that. You may

I have a small kit for a transmitter with a 1km range. If I use a larger recieving antenna and a more powerful receiver could I get better range. For the link between the station and me all I need to get is about 1000 bps.

I was actually thinking of building my own gear. The 10Mb wouldn't be between the actual weather stations more like 1000baud. Where I want 10 Mb is for the rest of the network, where I would need email and HTML content to be carried.

> What is the distance between stations?

Up to 5km from my location.

All I need on the station side is 1000baud. I will then process it on my computers for rebroadcasting into a packet network using TCP/IP.

> BTW, it is VERY easy to pass the test for your Amateur Radio Technician
> class license - no Morse code test is necessary.

In Australia it is actually called a Limited liscence, but allows the same thing

>
> Let's talk apples with apples.

I did a simple experiment.
Made the measurements over a period of time.
CLOVER moved about twice the data per hour compared to PACTOR-II.

Note in the above "... based on my EXPERIENCE ...".
No point in arguing with this observation.
It is simply what I observed, and continue to observe.

Note also that I observed that PACTOR-II appears better for
weak signal (and low data rate) work. Others may have different
observations.

For weak signal work, I personally prefer CW.

Cost and availability. 9600 is not expensive, and is in wide use.
56k is expensive and is not in wide use.
There is no plug and play controller available, you have to build
at least portions yourself.

The Europeans have some faster (56k / 70k) networks running.
Perhaps someone will explain cost and availability of that gear.

As long as it is 1200 or less (one kind of hardware), 9600 or 19200 (a
different
kind of hardware), etc. You will need a good test bench to debug your
hardware (scope, counter, dvm, etc.)

Unless one is surrounded by large reflectors, e.g. mountains.

The interesting test would be PSK31 on 2M over a 500 - 1000 km path.
i.e. moderate to long troposcatter paths.

wrote:

>> 10 Mbit/s only exists on some random experimental links, not in general
>> operation.

>What barriers stop it from general use?

First of all 10 Mbit/s will require a 1000 times (+30 dB) more
transmitter power than 9600 bit/s (and 1200 bit/s) for the same
distance with the same antennas. Or if the transmitter power is the
same, the distance drops to 1/30 (the inverse square law) if there are
a line of sight condition (which is quite rare for amateur
connections) or drops to maybe 1/200 distance in urban areas without
visual contact (the 1/r^4 "rule").

With the quite low ham density, how many hams could you reach from
your home station ? It has been notoriously difficult to get hams to
support common infrastructure, the local repeater in your town is
usually the only thing that can be done and get financial support from
the local ham community.

The other problem is multipath in situations when there is not a
really clean line of sight path and where extremely narrow beam
antennas are not used. Practically all amateur link are of this type,
a good line of sight link is a rarity. Commonly used modulation
methods, such as FSK and PSK do not work very well in multipath
environment. To combat multipath, some form of spread spectrum or low
symbol rate multicarrier systems such as COFDM is really needed. Until
chips intended for both receiving and _transmitting_ DAB or DVB-T
(which both use COFDM) are readily available, I do not think that
there are going to be a lot of high speed ham connections.

Practically all high speed connections require a full duplex
connection (or a half duplex connection with very fast turnaround
times), implementing this at high power levels (> 1 W) can be tricky
and may require the use of different amateur bands for each direction
with separate antennas for each band.

It is not available as an off-the-shelf item in your local hamradio shop.
Although you might get the impression that amateur radio is about
experimentation, this is a description of the situation 20 years ago.
Today, most hams only connect ready-built equipment and mumble about how
they could never build it cheaper.

The few projects that describe homebuilt 10 Mbit/s links are not at all
suitable for broadcasting. They use frequencies similar to TV satellites,
and the antennas for these frequencies normally have very small beamwidths
and thus are only suitable for point-to-point use.
To use anything resembling broadcasting, you would have to setup a network
of point-to-point links with interconnecting nodes (routers).

Definately not. I want to set up a high speed, experimental wireless network for scientific and educational use or science enthusiests. Basically what the internet was before commercial stuff came in, but free. It would only be over a small geographic area.

This was sort of what I was thinking of. A few fixed location stations linked together with something like CSMA/CD. They would use a single frequency in a certain area. This would be similar to ethernet. When one station transmited a packet, all would receive it and would then pass it up the TCP/IP stack. If the data is for that station it is taken to a computer. It could also allow multicasting, where a single packet could be sent to multiple stations simulataniously saving bandwidth. If anyone is wondering, yes I am trained in computer networking. Would anything that I haven't thought of stop this sort of system from working, apart from some amateurs not liking the idea?

So I would need one of the following:
1. Powerful transmitter
2. 300ft high antenna
3. Lots of repeaters

> With the quite low ham density, how many hams could you reach from
> your home station ? It has been notoriously difficult to get hams to

Not many. In fact in the short term the only likely HAM to tune in will be me, when I'm away from home and want to download the latest weather details. Maybe a few storm chasers would also want to link in with mobile stations for viewing weather info. I wouldn't want financial support from anyone. My idea would be if you want it you build it and you pay for it. I would pay for my gear my self. If some bloke down the street wants to join, he would pay for his own gear.

I am not familiar with the modulation methods used by HAMs in packet radio, but surely there would be some system that could be used. The most important things would be to use some sort of manchester encoding or frequency modulation. Multipath transmissions could be filtered out somehow.

Couldn't you just do it like ethernet? Shared medium/frequency. Only one station can talk at a time. If two transmit and the same time, this would be detected by the transmitting stations, then one would pause, wait for the other to transmit then continue. Checksumming would be definately required and window sizes would have to be small(<100).

As I wrote (or tried to write): this is not practical at 10 Mbit/s.
The packet system at 1200 and 9600 bps works that way, but at 10 Mbit/s you
are really limited to point-to-point links. Dedicated equipment at each
end of the link.

See it as a leased line, not as an ethernet. You can build a large network
out of leased lines (like the Internet), but when you are not somehow on
the network (= have a link to another node that is on the network) you can
do nothing.

You will have the problem that it will be both non-free in the sense that
you cannot use it for anything you like (limited by license conditions),
and non-free in the sense that it will cost *a lot* to build, and someone
has to pay for it. If not the users and/or contributors, who else?

Most attempts to do what you are trying to do (there have been many, at
least on paper and in late-night chats) have failed because of this.
Everybody wants to have a network for free, a lot fewer people would want
to pay for it, and even less would want to spend a lot of time building and
maintaining it. So, after a while it will turn out that you have 100
users, 10 who contribute $10/year as a generous donation, and only 2 or 3
who are doing all the work to keep it running.

Worse: 10 of those 100 users, 7 of them from the group "that paid for it",
will call you at 23:00 because "their link is down", or will spread
messages that "the link has now been down for a week and it is all so much
better managed in <fill in your neighboring state>".

I can assure you this is not going to be fun for long. I have been in it
myself.

I did a couple of tests on 2m PSK31 last year over a path of about 80 miles and noticed that the main source of phase shift was aircraft reflections, otherwise it's a good mode for VHF. The aircraft echoes appeared as an interfering signal which drifted across the operating frequency and then moved away.

I agree with the other poster about rig drift, a local PSK31 station on 2m using an FT902DM plus a solid-state transverter drifted nearly 500Hz in the course of a half hour QSO! The same rig (without the transverter of course) was rock steady on 80m.

From: Bob Nelson <bob@inkwellpress.com>
Message-ID: <B56F9817.3D6A%bob@inkwellpress.com>
Source record: 12325

June 15, 2000 - 11:30 AM PDT
FOR IMMEDIATE RELEASE - Website advocates MP3.com boycott

NetRadioLive, an independent Webcasting site operated by Jordan Dorf and NetMediaLive Productions, has issued a call for independent artists, musicians, and Web listeners to boycott the MP3.com service immediately. This boycott stems from an inflammatory statement filed in court by MP3.com CEO Michael Robertson on behalf of the RIAA, as part of a collective effort to shut down the Napster file-sharing service.

According to Jordan Dorf, CEO of NetMediaLive Productions and host of the NetRadioLive webcast, "In this brief, Michael Robertson and his company are trying to assert proprietary rights over independent works. Artists submitted these works to MP3.com under a non-exclusive promotion agreement, yet Robertson wants to block them from promoting these same works on Napster and other file-sharing services. This is hypocrisy, and in its desperate attempt to appease the RIAA, MP3.com is now screwing the artists and the listener community that helped it become successful in the first place.

"We urge independent artists to remove their MP3 files from MP3.com immediately, and to send a clear message to MP3.com that they will take their eyes, ears, and MP3 files elsewhere until Michael Robertson retracts this outrageous, hypocritical statement."

The original Robertson brief, as it was filed on behalf of the RIAA, can be found at the following URL:

http://www.riaa.org/PDF/robertson.pdf

More information about NetRadioLive and the MP3.com boycott can be found at the following URL:

http://www.netradiolive.com

Requests for comment may be directed to Jordan Dorf by telephone at (877) 959-8256, or by e-mail at netradiolive@netradiolive.com .

In Ethernet, the transmitted and received signal levels are nearly the
same.

>Shared medium/frequency. Only one
>station can talk at a time. If two transmit and the same time, this would be
>detected by the transmitting stations, then one would pause, wait for the
>other to transmit then continue.

In radio communications, the received signal can be more than 120 dB
weaker than the transmitted signal. If you try to do this even with
highly directional antennas, some of the signal will escape towards
the ground, trees or buildings and a small fraction of this will be
reflected back and get into the receiver. As soon as you start to
transmit, your receiver will get the spillower, stopping your
transmission.

I believe I could take what is available on the net, in manuals,
and from the ARRL, a good signal analyzer, and a closed loop
test system and build a decoder. There can hardly be any secrets
in a system where the input and output are known and one has
the modulating audio available for analysis.

Got this from Hans ... guess he doesn't have internet access.

I'm not certain what message I was asked to post ... but here are a couple.
Seems that Hans confused what someone else posted with my responses
to that post. So i get a bunch of emails from him ... eh?

> Hank,

> I understand you have been stirring up all kind of shit again lately.

You understand incorectly. Read the newsgroups, respond there.

> You know, Hank, I do not mind being critiqued nor do I
> hide behind a brick wall.

You have just done so by not posting this to the appropriate newsgroup.

> But I do have a serious problem with folks like yourself when you take
liberty to
> criticize others on nets and similar broadcast media and at the same time
refuse to
> post messages by those who you attack (me in this case)
> when we are trying to clarify and straighten out your obvious
misunderstandings.

What nets are you talking about? What "... broadcast media..." ? CBS? NBC? CNN?

> The WinLink group has done more in the recent past for the betterment and
growth
> of the HAM community than anyone I
> know of. I don't know if you feel threatened or abandoned
> or what it is, but you sure are not making friends with the kind
> of bullshit you send around.

I'm not the one who feels threatened.

> I suggest you study and learn what WinLink 2000 is really all about - you
might be very surprised.

Did that, no surprises.

> Do as you wish, just shut up and stop playing god.

Afraid of the truth?

> Hans - N8PGR

Perhaps the following is what he's talking about?

See your point 3. below. Please explain how WinLink is "compliant" if it
does not allow for "... interactive keyboarding ...", which is the main focus
of traditional BBS systems.

> Now granted, with WL2K with have moved FORWARD a giant leap by doing three
> very important things:
> 1. Intra BBS forwarding is removed from the airwaves so that USERS can use

What a giggle. "We're the good guys, we avoid using ham radio!"

> 2. NEW features have been added to allow more efficient forwarding of
> information between WL2K base stations and the users. True, presently only
> AirMail has adopted these features, however, the specs are public and anyone
> is welcome to join the bandwagon.

Presumably you have bulk compressed forwarding now?
That "... giant leap ..." was done many years ago in all the BBS codes
I know of, except for WinLink.

> 3. The only feature removed from WinLink 2000 is interactive keyboarding
> with a base station, again, to promote more efficient use of the airwaves.
> Since client software is free and readily available to anyone who wishes to

The fact that a protocol is proprietary or patented does not make it illegal on the amateur bands; I'm not sure where you got that idea. If you re-read the regulations you will note that only encrypted communications or those whose meanings are intentionally obscured are prohibited. The fact that the FCC (or anyone else) can't get the necessary equipment for free is not an issue.

You guys are a giggle. Can always get this knee-jerk response out
of one or another of you. Hams using the telephone when they can't
manage communication via radio is not "progress", it should just
be called "failure". So I call it that.

Why should I do that?
The networks are gone bubba ... they were killed off.
Got better things to do.

I HAVE read the WinLink information, and HAVE run the program.
But I do not agree that it is "progress" or "new technology".

There is enough freely available public information on PACTOR II
for me to build a decoder. There is not enough freely available
public information on CW for *some people* to build a decoder.

It is still a simple build or buy decision. A CW transceiver is
easy to build. An SSB transceiver is a little harder to build.
A PACTOR II decoder is harder yet but certainly not impossible.

> And therefore illegal on any amateur band?

Can the FCC freely decode it? Yes, therefore it is not illegal
in the USA. I'm not familiar with Canadian amateur rules.

Humorously:

I tried my list of Phone BBS systems. Damn things are all gone now. I think the Internet has ruined the Phone BBS programs as well. What happened to all those great Node BBS systems? Wow, I can't believe no one wants to put more of the Phone and Radio BBS systems up. This Internet thing is only a flash in the pan. What will happen when the Internet systems all go away?

Seriously:

People who try to network (or just link BBS) narrow-band radios for textual and graphic information flow in the 21st Century, are completely brain-dead as far as I'm concerned. People who use narrow-band radios to communicate with human operators is the only logical arm of the hobby to survive. I know of no one who uses a BBS for anything anymore. Even our office Bulletin Board is outdated, as what we need is on the main Web page. I just checked, it has a 1994 Energy Conservation Poster on it.

Part-15 (wide-band networking) is the only way to go now. Part-97 (wide-band networking) is legally restrictive and the deadest part of the hobby.

FCC Rules 97.309(a)(4) "An amateur station transmitting a RTTY or data emission using a digital code specified in this paragraph may use any techique whose technical characteristics have been documented publicly, such as CLOVER, G-TOR, or PacTOR, for the purpose of facilitating communications."

So, FCC rules specifically authorize the PacTOR mode. Apparently the technique is documented sufficiently to satisfy the FCC.

The FCC appears to look at the "code" as a separate issue from the "technique". If the individual characters inside the protocol packet are ASCII or are derived from ASCII (as done with compression) *and* are not intended to be encription then the code is ASCII. CLOVER, G-TOR, PacTOR, and Packet are all legally ASCII codes regardless of the different techniques (protocols) used.

Art,

I have written and read many patents. In most countries, in the disclosure of a patent, you are SUPPOSED to disclose enough information that would enable a person skilled in the art to build a working machine that will implement the protocol.

But many patent do NOT do this! If the claims of a patent (where the monopoly rights are defined) are not fully supported by a proper disclosure of the invention, technically in many countries, a court can invalidate the patent (or the patent office may not grant it in the first place).

But this is VERY RARE even if the patent disclosure is deficient. (Courts tend to find other reasons to invalidate a patent).

In many countries, the granting a patent or a monopoly for an invention is based on the notion that in return for disclosing the invention to the public, the state will grant you a patent or a monopoly for a limited period of time (typically 20 years from the date of filing). Some folks think of it as some sort of contract between the inventor and the state to promote innovation. The state wants inventions to be disclosed and not kept secret.

You may ask why are so many patents are poorly written. Well in the vast majority of countries, you must file a patent application BEFORE you disclose it to the public in any way. In many countries, if you disclose the invention to the public in any way before filing a patent application, either the patent will not be granted in the first place or a court will invalidate it later (if someone challenges the validity of the patent). Very few countries have a grace period.

In the fast paced world of high tech, there is typically a race to file a patent application with the patent office(s) as soon as possible so you can then tell the world all about it. The marketing folks are always chopping at the bit. As a result, sometimes a patent application is filed BEFORE a working version of the invention is even made! Under these circumstances, it is hard to write a proper disclosure.

Furthermore, it is very common that after a patent application has been filed (and even after a grant of a patent), the inventors fine tune or change the details of the protocol (or working machine etc). (Sometimes they even change the real invention that they want protection!)

It is important to note that in many countries you can change the protocol without changing the invention and still obtain protection under the patent. For example, if your patent is for memory ARQ, then any protocol that you implement using the same memory ARQ should be covered by the patent.

Perhaps, SCS filed a patent application for a protocol similar to Pactor II but contains the KEY invention. If so, SCS may never have fully disclosed the real Pactor II protocol in a patent application.

I am not familiar with the patents for the Pactor II protocol filed by SCS. But I suspect that even if the disclosure of the patent did disclose all the details of the Pactor II protocol, it is likely that the inventors at SCS have fine tuned it and changed it sufficiently that even if you reproduced the protocol described in the disclosure it may not be compatible with the current Pactor II protocol in the SCC PTC II or SCS PTC IIe.

I would also like to point out that intellectual property rights are territorial in nature. For example, if SCS did NOT file a patent application (or applications) in Australia that cover ANY aspect of its Pactor II protocol, you might be able to legally make and sell modems in Australia using the Pactor II protocol (depending on any other laws in Australia which may be applicable). I am not familiar with Australian law. I am just trying to show the territorial nature of patents.

It would be interesting to find out where SCS obtained intellectual property rights for Pactor II. It would also be interesting to see what SCS claimed as the REAL invention. Was it some sort of advanced memory ARQ?? Did the patent claim broad protection?? Or is the patent protection very narrow so that someone could make a similar protocol and not be caught under the claims of the patent (or another patent)??

Hmmm ... I find several the ones I've used still there.
Silly of them not to move forward to better protocols, using
the same medium (the telephone).

You still miss the point: this is not about internet protocols
vs. other protocols. I run internet protocols over ham radio.
It is about avoiding the use of radio by pretending that running
ham radio traffic over the internet is somehow "doing ham radio".

This is certainly true, but has nothing to do with Amateur Radio,
the topic of this newsgroup. Perhaps you should stop posting
here (in this Ham Radio newsgroup) and instead post some
other newsgroup, devoted to Part-15 devices.

Can I retain my link with WB1DSW (Oregon to New Hampshire)
using Part-15 devices?

Bob,

I don't think it is very relevant that the FCC regulation MAY make a distinction between the code and the technique used.

In my view, the FCC likely equates the term "technical characteristics" of a code with 'PROTOCOL"

According to the regulation, the "technical characteristics" of the digital code must be "documented publicly" before a HAM can use it legally. In other words, it is my understanding that secret protocols cannot be used by US Hams.

In my view, this makes sense. Then the FCC can theoretically decode any of these new protocols (using any equipment they may wish to use or modify).

HAL has published documents on its CLOVER and CLOVER II protocols, etc. (But I have heard some argue that HAL really has not published publicly all of the details on its CLOVER and CLOVER II protocols). But since CLOVER is specifically mentioned in the regulation, it may be a moot point.

The regulation does specially mention Pactor but does NOT specifically mention Pactor II whose "technical characteristics" are quite different.

The issue remains. Has SCS documented publicly all of the "technical characteristics" of its Pactor II protocol?? It would appear that a lot of folks do not think so. If that is the truly the case, all the US Ham's running Pactor II may be doing so illegally.

Thank you Judge Sampson!!

Seriously, I do not think any US court has considered whether Pactor II is
legal under the law as presently written.

It still may be illegal for US Hams to operate Pactor II.

Even if the FCC states that Pactor II is legal (and I am not sure whether it
has made such a statement), a US court could rule that use of Pactor II by
US Hams is illegal under the law IF the all the "technical characteristics"
of the Pactor II protocol were never documented publicly.

I wonder whether the FCC has even seriously considered the matter.

No offense, but this is a really silly thread. There is absolutely no question as to the legality of any digital transmission made 'in the clear' using a common protocol, publicly documented or not, so long as the transmission is not encrypted and/or there is no attempt to obscure its meaning. The FCC can monitor Pactor II transmissions at will.

If you are very concerned about this I operate Pactor II regularly and my address is current in the database so it should be easy to catch me on the air. If you want to learn the meaning of the regulations and don't mind wasting several minutes of the FCC's time, please 'report' me... in fact, if the FCC wants to contact me I will be happy to schedule a Pactor II QSO with them. :-)

They decode mp3's just fine - so running an fft and a few correlations shouldn't be any problem. Efficient implementations of PSK31 don't require much horsepower - look at WinPSK. I think it uses about 4% cpu power on my desktop machine. Most CE devices have audio input, I'm not sure about the Pilot though.

Please note that in the prior message I meant to say "in the public domain", not "publicly documented", as the latter is indeed a requirement (met in every SCS PTC-II owners manual).

I think the real underlying question here is... what you guys got against this mode anyway?

In order for a court to proceed, there must be a case. The FCC, in the
U.S., has no intention of making a case (quoted on the ARRL Web Page).

> It still may be illegal for US Hams to operate Pactor II.

May?

American law is based both on both the statute and enforcement. In the
case of *any* 8 bit code on HF, the FCC has said it will not enforce the
7 bits restriction. There can be no case.

> Even if the FCC states that Pactor II is legal (and I am not sure whether it

Well, when you get done with your "what if" screen-play, let us see the
final script.

> I wonder whether the FCC has even seriously considered the matter.

Yes they have. They seriously don't care. They have very limited funds
to spend on hobby spectrum enforcement.

Get on with your life...

You confuse the argument. The argument is about connecting
anything to a radio other than another radio. You would have us
believe that people who don't use radio as an interface are corrupt
and "not real hams" (whatever that means).

People on the other side of the aisle propose that connecting
anything to a radio is not only technically sound, but the most
efficient way to add value.

When people connect a telephone to a repeater, they do so to
expand the versatility of the radio. Same with a modem or
internet connection. To restrict people to only using a radio,
and no other interface device, is completely juvenile in my book.

>This is certainly true, but has nothing to do with Amateur Radio,

Hey, you keep talking about telephones, I could ask you to leave
as well. But that would be juvenile as well.

>Can I retain my link with WB1DSW (Oregon to New Hampshire)
>using Part-15 devices?

The real question is: what *value* do you add to the Amateur Radio
Service and the hobby, by maintaining said link? What value would
you add if you removed the self-imposed restriction on interfaces
to the radio? Could we get the out-of-band radio mods or WW
info from Brazil and Portugal, or all the sales info another way?

I've not said that. If you think I have, quote it.

> People on the other side of the aisle propose that connecting
> anything to a radio is not only technically sound, but the most
> efficient way to add value.

That is not what they propose, or do.
They move traffic using the telephone INSTEAD of using radio,
not IN ADDITION to using radio.

> When people connect a telephone to a repeater, they do so to
> expand the versatility of the radio. Same with a modem or
> internet connection. To restrict people to only using a radio,

Straw man.
We are talking about people who TAKE THE REPEATER OFF AIR,
because "You can do this better on the internet, and it won't tie up
a valuable frequency pair which MIGHT be used for low speed CW
EME communications."

> >This is certainly true, but has nothing to do with Amateur Radio,

Earth to Steve: Emergency communications capability.
That is one of the values provided by Amateur Radio.

> What value would you add if you removed the self-imposed
> restriction on interfaces to the radio?

1. My radios are ALL connected to the internet.
2. The point was using the internet INSTEAD of radios.
3. You are very very confused about the issues.

I don't see a problem either way. Too each his own. Radio is
Radio, whether it is an end-point or a trunk. Hams seem to enjoy
radio regardless.

I hazard a guess that Ham radio didn't lose one radio relay that
wouldn't have gone away for many other reasons than just being
displaced by non-radio circuits. I've seen at least 10 BBS's come
and go just because the trustee got bored.

All the various Hell modes are great for keyboard QSO's.

In particular, I really like PSK Hell!! PSKHell is a great weak signal DX mode.

In my view, PSK Hell is much more sensitive than PSK31 and is much better at dealing with polar flutter. And since I can't type any faster than the speed of PSK hell, PSK Hell is perfect for me.

I wish more HAM's experimented with PSK Hell.

I get frustrated with PSK31 since it can't handle polar flutter. I have not been able to make any QSO's with stations where the path is over the poles.

Of course, since Hell sends characters as images, you really cannot send binary data.

But each mode has its purpose. In my view, the Hell modes are great for keyboard QSO's. And the software is FREE!

The modulation method is publically defined so basic decoding
is easy. Knowing the input data and the raw decoded wireless
data, one can determine the character level protocol. I personally
don't see much difference in engineering something and reverse
engineering something. It's all just an engineering problem
to be solved. Have you checked for any patent information?

That is correct. The FCC makes no statement as to the level of public documentation nor where it must be made available to be considered publicly documented. Since SCS has the manual available on their web page I would think that qualifies as public enough. I believe the FCC's intent is to ensure that transmissions are not encrypted in order to prevent others from monitoring the content (not to ensure that anyone can build a decoder from the documentation). Anyone who wants to monitor a Pactor-II transmission can simply purchase a PTC-II so there is no intent to encrypt the transmissions with Pactor-II.

Just to satisfy the letter of the law, the ARRL has published a small
book with adequate descriptions of a number of different protocols.
I can't locate my copy right now, so you'll have to look it up for
yourself on the ARRL web site.

It's not free. I also believe the PTC Owners Manual does qualify,
since it's readily available from SCS, or Farallon here in the US.
And in fact, is available for free download from the SCS web site.

It's not in your local newspaper, that's true, or even your national one.

wrote:

>Would mobile stations be possible? or would you have to drop to 115Kbps or
>56Kbps?

The problem is multipath or more precisely selective fading, in which
the direct and reflected signal cancel each other _at_ specific_
wavelengths. If you are using a narrow band modulation method, this
can ruin your signal completely. In a mobile environment, you may have
several signal dropouts every second.

One way around this is to use interleaving and since maybe 1 to 10 %
of time the signal is corrupted in a mobile environment, the error
correction can take care of these burst errors. The problem is that if
you stop _at_ the signal null e.g. due to traffic light, there is not
going to be any communication.

The other approach is to transmit on different wavelengths, of which
some are always taken out by selective fading, but most wavelengths
will get through and the ECC can reconstruct the message. There are
various ways of doing this. In (frequency hopping) spread spectrum,
the signal is transmitted at a large number of wavelengths sequently
one wavelength at a time, in COFDM a large number (up to several
thousand) wavelengths are transmitted simultaneously.

Unfortunately none of these techniques are used by hams (except for
some scattered tests).

You should not need to reverse engineer the protocol (using
the signal analyzer and the closed loop test system)
to get enough details to build a decoder.

Should I assume from your reply then that there is NOT enough
freely available public information on Pactor II to build
a decoder, and therefore the protocol is proprietary?

And therefore illegal on any amateur band?

Jerry, on the same site that you downloaded the software is a fairly
full explanation on what it does. Install the software, there is also
documentation in that. AirMail does operate with a KAM providing
it has HF capabilities.

Regards/Pat

>You would pay for the maintinence of your equipment. If everyone broadcasts
>on the same channel, then you don't rely on any specific links.

But then you rely on everyone's capability to hear another. That will be a
costly mistake, that you will only discover when you are beyond the stage
of initial experiments...

>>Most attempts to do what you are trying to do (there have been many, at
>>least on paper and in late-night chats) have failed because of this.

>Could you give me some examples of networks that have failed? URLs?

Few people have the motivation to document a failure.

>>better managed in <fill in your neighboring state>".

>If it used my system, it wouldn't be my problem. And noone would complain
>because no one pays for it. They pay their own gear.

The only problem is that your system does not work in practice.
It is re-invented every decade, and people try to set it up only to
discover that it starts to break down once the usage of the channel gets
beyond a certain level, and the number of stations that do not hear another
(and thus happily transmit at the same time) goes up.

The current breed of packeteers that is wandering into this trap is using a
mode called APRS. From what I understand about your intentions, you should
just drop your datarate expectations to 1200 or 9600 bps and dive into the
APRS thing. It works the way you think a network can work, and you will
quickly see what the limitations are.

Only it does not use established network protocols like IP (with
multicasting), but it builds on the amateur packet protocol AX.25 in
datagram mode, with an ad-hoc definition of datagram contents.
(position reports, weather reports, short messages, etc)

Search for APRS on the WWW.

Hank, you ever hear of progress? All this mumbling and grumbling won't do a thing for you except give you ulcers. I'll bet your ate up with them. I ran two systems for years, WinFBB and WinLink, each having it's own purpose. WinFBB served the local community, and yep, I had internet connects. Wanna know what killed packet Hank? BBS's swapping traffic for hours on end, and the poor user could never get his traffic off his BBS because it was always BUSY forwrading bulletins. I'd much rather have fresh bulletins on the system than wait hours and hours to get it off HF or VHF and users accessing the system and NOT having problems. I wonder what the ratio of hams that have internet access vrs those that don't? People have moved to the internet where they can get what they want, when they want it and from whomever they want it from in a timely fashion. And the reliability is better than packet could ever hope to be. As for WinLink (and now WL2K) it serves another purpose. /MM's and RV'ers and also P and NTS type traffic. Give over. Quit kicking a dead horse. Admit your living in the past, and your glory days are over. Now all you seem to be able to to is mumble and grumble. So what if WL2K and WinLink have an internet interface? It works, and works well, I might add. So WL2K must use a FBB type client such as AirMail? Your a programmer. Come up with something better that what's available now without using the internet. Maybe you'll get some converts. I suggest you read the information found on the internet as to what WL2K really does, Hank.

Yup, that was Paccom. They no longer service what they sold.
Ask the VE3EQP. There was a dispute (from what I've heard) that the
was a dispute between Paccom and SCS, what it was, I don't know, and
don't really care either.

Yes, we'll be using PSK31 in our Field Day operation, probably mostly on 20m. I've only been on PSK a short time but it's been interesting to explore. My daughter, the chat room fan, likes it a lot. She types like the wind and hates microphones. We thought it would be a good public demo thing. The concept of "chat" without a billion dollars of Internet infrastructure appeals to the kids.

I'll be using it. 20 meters will no doubt be the best band to work.
It seems to be the most used band for that mode right now. 14.069.5

Does anybody have a ready made interfaces for use with the accessory socket on an Icom 706MKII?

Does the hf and vhf side use seperate ptt lines? Please reply directly.

Trunk solutions are the way to go:

The distance covered is actually quite good. The rules are basically
1 dB of gain reduction (after 6 dB) for every 3 dB of antenna gain.
That means that 1 Watt (30 dBm) can go into a no gain Omni, but power
must be reduced 1 dB (to .8 Watts) for a 9 dB gain Omni (6 Watts ERP,
and heck, that's better than my Alinco handheld).

I have a system in operation that covers about 5 miles and is roof-top
height. Given any altitude the range would easily double with the
27 dBm into 20 dB gain antennas (that's almost 50 Watts ERP if my
math isn't way off).

Anyway, "very small area" isn't a very good term.

I understand TAPR is interested in producing a vocoder kit designed
by Charles Brain, G4GUO. If they did, that would give you a source
for 9600 bps FEC digital audio. If each of these was connected to
portable telephones and LMR/HAM repeater systems, you could connect
about 90 of these through a Mux to a 1.8 Mbps Part-15 radio. Combined
with a pure data channel (two stacked beams) would provide both data
and voice capability. If you could get by with 2400 bps FEC voice,
then you could have about 350 voice channels Mux'ed onto the link
(and 2400 sounds really good using the AMBE chip).

What we want to do is give every Forest Firefighter, or any Emergency
Tech a personal radio and set up split-band or simplex repeaters for
them, and portable phones (headsets) for the deployed command center.

Then shoot the Mux data out of the affected area. What I envision is
one of those booms the TV crews have, or a hilltop, skyscraper, etc.
For example, the OKC Bombing required less than 1 mile to get out of
the affected area. A Forest Fire, Earthquake, or Flood would be a
worse-case, with possible radio (trunk) relay sites to the nearest
infrastructure.

But all you need is a T-1 that is available at most Telco or
large business, to plug your Part-15 10Base-T into, and a Mux at

the regional command center.

My basic argument, is that the long-haul links are mainly displaced by highly redundant circuits. I would say that High-Seas long-haul is still something that HF might be useful for, but every big boat has a SatComm for both voice and email these days.

My other secondary argument, is that Hams no longer have the *only* radio solution today. Family's have FRS (I know of two families that have one of these radios for every person), you see them at the Malls, etc. FEMA has blown everyone away by upgrading communities to new Trunk systems. The bad old days are gone, where a 100 Watt 2 meter or 20 meter rig, and a bunch of donuts could be used to save lives. There is an use for 30 baud circuits, but emergency isn't one of them.

Steve

So my link to WB1DSW would only require something like
200- 400 repeaters. Gee, that's useful!

Well, I'm sorry, I could have drawn you a picture so you could understand the concept, but most here frown on binaries.

Depends on whether you want more than 30 baud effective. If you do, the internet connection would replace the 200- 400 repeaters. The radio would be for local access and linking.

What internet?
We are talking about emergency communications, and communications
to places that do not have telephones. See the thread topic.

Um ... my HF links get a lot more than 30 baud effective.
That's the "modern technology" thing you always harp on.
What's important is BPS not baud ... but you know that, right?

Perhaps everyone who posts to this newsgroup is unaware of what
hams in the US can (and do) do in cases of emergency. Here are some
guidelines we use in this part of the country.

Emergencies where communications by hams can be valueable fall
into three basic types:

1. Local. The example here is a train derailment in a remote area,
which caused a toxic liquid spill into a stream feeding the water
supply of a medium sized city. The place where the wreck occured
was quite remote, up one of the many valleys in the Cascade
mountains. Most emergency services radios did not work from this
remote location. Hams set up a portable voice repeater at the
mouth of the valley, and took HTs up to the wreck site. This provided
the needed communication. This kind of emergency occurs several
times each year.

2. Regional. The example here was flooding in the coast mountains
a couple years ago. Although each of the emergency services agencies
had radio contact with their own people, they could not communicate
between each other. Again a portable voice repeater was placed on
a ridge above the main area of flooding, and a ham with an HT was

assigned to each agency. Issues were things like coordinating the
destruction of a major road to allow flood waters to drain, which
needed discussion between the contractor running the D-9, the state
governers office, fire and rescue, the Red Cross, etc. This worked out
quite well ... and the state has since installed a "joint trunked radio system"
which allows any agency to patch through to any other agency.
This kind of emergency occurs every few years.

3. Major. The example here has not (yet) happened, but will some day.
The PNW is subject to rare periodic large earthquakes. Magnitudes
usually between 7.5 and 8.5, but larger quakes are possible. The last
quake occured MORE than one repeat interval ago, so the probability
of a quake is higher than "usual". Repeat interval is 200-300 years.
The expectation is that there will be no remaining communication,
power, or travel infrastructure. Cell towers and power line towers
will be on the ground. One or more major dams will breach, washing
away several small cities on the Columbia river. There will be on the
order of 100,000 dead and 300,000 injured. There will be no drinking
water. Most, if not all, ports will be destroyed or seriously damaged.
This is much like your "asteroid" scenario. What hams can do is provide
HF communications out of area to get the intial assesment to the agencies
that can help. HF because the places we would need to communicate
with are state capitols of nearby states (200-600 miles) and to Washington,
DC (1700 miles). We all hope this emergency does not take place ...
... but if it does, hams will be available, and have the equipment, to help.

Dunc,

We've tested the USB interface in house and it works fine with Pacterm '98 and the KAM. To both of them, it just looks like another serial port. The Belkin hub, as the Entegra, works fine if the USB interface on the computer works fine.

I'd recommend setting both the KAM 98 and Pacterm '98 at 9600, since that's Pacterm' default. If you need any addtional help in setting it up, please call us at 256-381-6100. My tech guy Bill (WD4HEN) is there M-F 8-5.

Portable nodes and BBS systems were used extensivly during the 1987-
1988 forest fire season in California. Nodes heli-dropped to ridge top,
BBS in laptop placed at the staging areas. Allowed printed situation
summaries to be automatically forwarded to state government in Sacramento
on an hourly basis. These were in areas with no cell coverage, and very
little other radio coverage. There is a lot of VERY remote wilderness here
in the western US. Hams got a lot of good press from this. We also lost
a couple portable node boxes (two tncs and radios plus gel cells) when
the fires moved across the ridges they were placed on ...

Ham gear does NOT have better survivability. However, hams know
how to put together working stations from what can be salvaged, combined
from several different stations, etc. We even know how to make antennas
out of downed telephone cables (smile). It is the trained people that are
important, not the fixed location radio systems. That's the whole point.

But that is exactly what I said above "... nearby states ...". This level of
earthquake produces major damage for several hundreds of miles. The
nearest large cities are 200 to 600 miles from Portland, Oregon.

To make the point a bit more clear, if a quake like this happened in
Finland near Helsinki, the damage would be nearly total for all of
Finland except the far north, and would extend into most of Estonia,
most of Latvia, and well into Russia. The tidal effects would cause
serious damage to all the Baltic ports, most would be useless until
rebuilt. A very few well-sheltered ports (perhaps Riga) might remain
operational. 10% of the population would be dead and 30% injured.

Before someone asks where these numbers came from, they are from
analyses done by consultants using the USGS survey data plus historical
earthquake information for NW Oregon. We would have much more
damage than, for example, Anchorage sustained in their large quake.

> One part of the Field Day drill could be installing some BBS software
> to a computer that has already been connected to internet and forward
> traffic between Field Day operators over radio and say, ARRL HQ over
> internet.

Why not forward to ARRL HQ via radio? We were able to do that
easily from all 50 states only ten years ago, and in fact did so. It is
no longer possible, since the network no longer exists.

From the point of view of emergency services, the entire reason to build
ham radio communication capability is to provide trained operators and
technicians who can re-build and use whatever radio gear is available,
to create whatever capability is needed.

If the phones work, and the internet can be accessed, and commercial
radios work, then there is no need for ham radio. If hams do not build

and use digital radio networks on an ongoing basis, then they will not know how to build or use one when it is needed in an emergency.

Our national society (ARRL) has fallen down very seriously on this issue. Even much of the NTS traffic (designed to be training and test for handling traffic during emergencies) now uses the internet.

This is exactly the result I predicted 7 years ago when the Land Line Lids began to bypass the radio network.

If it is not used, it will atrophy. It wasn't, and it did.

98% of the content having no merit. I know, I read the crap. Also
85% of every message (regardless of content) was a header from hell.
I saw 100:1 header to meat ratios. For every 100 bytes transferred,
1 byte was part the message. Hell of a design. And with all that,
you still couldn't get a reply-receipt.

> See my posts in the "N0ZO" thread for a bit more commentary on the

> the internet, but fewer than fidonet.

There was also a communications revolution which had a significant
effect on the public. So many potential Hams were lost, the ARRL was
forced to back the FCC no-code license to improve the population. We
couldn't get anyone willing to learn Choo-Choo era technology.

> In this newsgroup you will mostly find hams who have no or little interest
> in building or using radio networks.

Networks or store and forward? Most here are very interested in RF
networks. Not many are interested in a BBS or email engine (S&F).
We got that already for free.

> Those that do ... spend their time on the radio networks (smile).

(smile, faint laugh, sheeeit)

> I'm retired, and can afford the time to do both.

The network people will come back, but only if the P-3 gets airborne.
Networking HF is like watching paint dry. Consumes a lot of time,
but there's nothing to show but a dry wall. Networking narrow-band
is worthless, networking with wide-band and a dish will be/is very
exciting.

> the whole growth and (near) death of it.

Hmm, didn't the Amiga come out in 1984?

For the record, I have a great time with Ham radio. I am excited by QRP HF, and microwave plumbing for the joy of Doppler audio. I love going to swap-meets, and I enjoy Unix and C. But I realize that cheap wide-band technology has made everything about Ham radio more of a hobby than a service. The stuff from the 80's and 90's are history, never to return. Stop whining, move on. CP/M is not going to have a second life.

Steve

2611. Re: IC 706MK2G and KAM 98 interface + USB connections

It'll work with the Wefax program, but sine Logwindows is 16 bit, it wont directly support the USB port. Once we move Logwindows to 32 bit (a free upgrade for you), we'll be able to support the USB ports in it. No worry, Logwindows still supports standard comm ports 1-4 for radio and Rotor control, and since you can sync the Pacterm window to Logwindows Packet window, you dont need to use the serial port in Logwin to access the TNC, or you can use the Telnet packecluster feature in Logwin to access the internet based clusters.

another
> (and thus happily transmit at the same time) goes up.

You would have to have a grid of areas. Each grid square uses a single channel. To get to stations beyond your square you use a gateway that sits in both channels. The limit per channel would have to be around 50 users.

> (position reports, weather reports, short messages, etc)

After some thinking I now realize that TCP/IP would be no good. It would have to use a protocol with the same versatility but adapted to take into account limitations of the amateur radio system. But the thing that I think is really important is not using a single system for all hams. What needs to happen is that all systems are linked into one larger network. The internet is a collection of heaps of different styles of networks, but they all work nicely together. To do the same with packet radio would require the setup of gateways between different types of networks.

Yes, it is quite clear you do not see the problem.

Those hams who force the forwarding traffic to go over the internet
deny me the ability to use radio to pass that traffic.

If you do not understand this then you do not understand
the basic operation of the forwarding network.

>That is one of the values provided by Amateur Radio.

I still do not understand the value of that coast to coast link.

Does the mid-West often get hit by a full scale nuclear war or hit by
a huge meteorite miraculously saving all the forwarding stations,
their operators and power supplies ? What information is so important
that it must be transmitted coast to coast and when it finally
arrives, is it of any value anymore ?

In practice, emergency areas are of a limited geographical size and
the normal infrastructure outside this area is working. Thus, it is
sufficient to get a connection from the emergency area to the outside
world. Emergency areas are seldom larger than the VHF/UHF range from a
well located analog or digital repeater, which must have emergency
power available. Even better is a mobile repeater or BBS station,
which can be driven to good place and operating as long as there is
gas in the tank. This can then work with portable stations in the
emergency area and also connection to stations outside emergency area,
which have working land line connections.

Such a mobile store and forward station is also very valuable for
search and rescue operations in the wilderness, since portable
stations can try to get contact to base station when they are at good
locations and thus save battery power, which is a scarce resource when
operating portable.

You think it is a bad thing that amateur stations connected to land
lines, are a work around bulletin forwarding networks eating up all
the traffic, but from _emergency_ communication point of view I think
it is better to think that individual radio links are work arounds for
faulty land line links. Of course, this requires that the traffic can
be limited to emergency traffic on the narrow radio channel. Part of
the emergency drill should be putting up a connection from the land
line environment to the radio environment, setting up the filtering
etc. A well located node or preferably digital repeater will extend

the communication range greatly. I do not see a need for store and forward capability, unless the stations have an intermittent (e.g. dial-up) connection to the land line network.

Hey Rob, why don't you stir the pat and ask the US Court. Some of
their decisons really suck. Look at the rights they have given
criminals, they have more rights than the victims. Who knows, you
stir them and they'll come out with the decisions that ham radio is
illegal and give all the amateur frequencies to those with commercial
interests. I think I would rather leave sleeping dogs sleep. I would
think you would better spend your time supporting/electing a
government official that supports amateur radio than stir the US Court
systems.

The failures I am talking about are not technical failures, but failure
to keep enough commitment to the project. When the commitment is lost,
there usually is nobody who wants to write an article about that.

>> The only problem is that your system does not work in practice.
>> It is re-invented every decade, and people try to set it up only to

This is the system that we have been trying to setup. Of course you do
not want to pollute your square with transmissions from a strong station
in the next square, so you use a separate frequency to link the squares.

The problem with this approach is that the integrity of your entire network
depends on the availability of the repeaters and their links. Once
repeaters start going down because of lack of commitment, your whole
network quickly falls apart.

>Anyone got a URL for APRS?

Stop dreaming - this is not going to happen. The world is too large to be
covered by amateur packet radio networks like it has been covered by the
Internet.
(the software that is in use mostly could do it, but the hardware simply
isn't in place and will never be)

You miss the point. If the equipment is not used on a regular basis, it
will not be maintained, and then will not be available, or will not work,
or nobody will know how to use it, in an emergency. The link with
WB1DSW was simply an example. Part-15 equipement can only be
used to link very small areas (e.g. neighborhoods). What is needed
during a large disaster (e.g. the Loma Prieta earthquake in California)
is the ability to communicate in and out of the area. After the quake,
very heavy use was made of HF packet links to move health and
welfare messages. The telephone system collapsed and was useless.
In some areas, the phone system did not become fully functional
until several WEEKS after the earthquake. The same was true of
many roads as well.

Source record: 12299

The TH-D7 is very functional. I have used it mostly in APRS mode and some packet. This radio takes a little getting used to since it has so many functions, but I am extremely happy with it. Some of the functions that Kenwood does not advertise is that this radio accepts control codes via its serial port: http://www.radiohound.com/control.htm and here are a few programs that make use of this feature: http://www.radiohound.com/d7zpinfo.htm . Another is that in addition to sending APRS messages, this radio can send very short E-mail messages over APRS. This radio has recently been upgraded to a TH-D7A(G). I would recomend purchasing this upgraded model. Here are the changes: http://www.radiohound.com/2000upgrade.htm .

I own two. One is hooked up to the internet for anyone to try. You will need Microsoft Netmeeting to view it, and Internet explorer to control it: http://www.radiohound.com/radio.htm .

Enjoy,

Walter

Portable phone repeaters are good for such situations as would
portable digital nodes or portable BBS stations, especially if the
users have some kind of integrated HT+TNC+display functionality as the
Kenwood radio.

However, there is not much use for fixed, point to point forwarding
VHF/UHF networks or digital HF links.

>power, or travel infrastructure. Cell towers and power line towers
>will be on the ground.

The problem is, why would the hams and ham equipment have a better
survivability in such a situations. Ham towers would come down as well
and fixed stations will be destroyed when buildings collapse. Only
equipment that was in the car has better chances of surviving and this
also requires that some ad hoc antenna must be constructed in order to
be able to communicate on HF.

> What hams can do is provide
>HF communications out of area to get the intial assesment to the agencies
>that can help. HF because the places we would need to communicate
>with are state capitols of nearby states (200-600 miles) and to Washington,
>DC (1700 miles).

I don't see the point why you would need the ability to communicate
coast to coast over HF, it should be sufficient to be able to
communicate with hams who live outside the disaster and who can
communicate to other places (such as the other coast) over land line
connections. The goal should be that any amateur living in places in
which the land line network works, should be able to connect the radio
to the land line network.

One part of the Field Day drill could be installing some BBS software
to a computer that has already been connected to internet and forward

traffic between Field Day operators over radio and say, ARRL HQ over internet.

After watching amateur radio newsgroups for a while I can see why. To much infighting. Nobody seems to be able to agree on anything!

Seven years ago the world was covered by a store and forward (BBS)
network, and extensive connected networks in many areas. For example,
it was possible, although slow, to obtain a connection from the southernmost
part of California to Vancouver, BC ... 1500 miles ... and to chat with
someone over this connection. That network no longer exists.

See my posts in the "N0ZO" thread for a bit more commentary on the
situation, and how it came to pass. The original store and forward
network was built in less than two years, included over 100 countries,
all linked via HF radio for the long haul link, VHF/UHF for short haul.
For a very short period of time, this network had more nodes than
the internet, but fewer than fidonet.

In this newsgroup you will mostly find hams who have no or little interest
in building or using radio networks. Those that do ... spend their time
on the radio networks (smile). I'm retired, and can afford the time
to do both. You can ask some of the others here about my credentials,
but one clue is that I wrote the software used to build the original
store and forward network, in late 1983 - early 1984. So I've watched
the whole growth and (near) death of it.

Thanks Rick. I appreciate the offer. Didn't expect to hear back from the real authority! HiHi

Hopefully by this time next week I will be up & working.

Did you test it with the logging & Wefax programs as well? I have ordered your Digital Trio from HRO and am waiting for it

Dunc
"Rick Ruhl" <ricker@cssincorp.com> wrote in message news:skqg9amie7f79@corp.supernews.com...
Dunc,

We've tested the USB interface in house and it works fine with Pacterm '98 and the KAM. To both of them, it just looks like another serial port. The Belkin hub, as the Entegra, works fine if the USB interface on the computer works fine.

I'd recommend setting both the KAM 98 and Pacterm '98 at 9600, since that's Pacterm' default. If you need any addtional help in setting it up, please call us at 256-381-6100. My tech guy Bill (WD4HEN) is there M-F 8-5.

So you see David, you are exactly correct. There are these folks like
Steve who follow everyone around the ham radio newsgroups to
post stupid negative comments. He has nothing else to do, except
to try an annoy people so he will have yet another post to complain
about. These are the kind of folks who killed off the networks.

Steve will, of course, reply to THIS post as well. He alway must
have the last word of complaint about anything anyone posts here.

However he was not around when the ham radio networks were
built, nor was he around when they were usable. He, and others
like him, killed off the networks.

It is a bit of a pain, but from time to time I take him out of my
killfile and read and respond to his silly postings.

Thanks again Rick.

Any target dates for the next release of Logwindows?
(So you know, I do understand target dates :-))

Dunc
"Rick Ruhl" <ricker@cssincorp.com> wrote in message
news:skr8a3tfe7f31@corp.supernews.com...
It'll work with the Wefax program, but sine Logwindows is 16 bit, it wont directly support the USB port. Once we move Logwindows to 32 bit (a free upgrade for you), we'll be able to support the USB ports in it. No worry, Logwindows still supports standard comm ports 1-4 for radio and Rotor control, and since you can sync the Pacterm window to Logwindows Packet window, you dont need to use the serial port in Logwin to access the TNC, or you can use the Telnet packecluster feature in Logwin to access the internet based clusters.

This was what I was thinking of, except maybe with scientific usage as a
reason to have the network.

Does this software still exist? I would love to have a look at it. I am
currently in training for a Cisco Certified Network Associate qualification,
so I have a lot of knowledge about conventional networking. Is anyone here
actually interested in stopping fighting and actually building a
non-commercial network to compete with the internet? I think a lot of people
are starting to get a bit sick of the banner ads, websites that aren't what
they are supposed to be and other problems with the internet(I certainly
am). It would require a whole new suite of protocols, but could include a
www. People could have their name or callsign as a domain, followed by three
letter country code.

The main barrier that I think your network seems to have had is speed. If
you could compress the headers down to just what is required to get the
thing to work, and increase the speed of the links to 1mb/sec it could be a
viable alternative to the internet. Educational and scientific users could
benefit greatly. Say a uni wants to have a network of seismographs they
would just have to link them to the network and they could have free access
to them.

It would require some central group to allocate IP numbers/domains, but it could be done if everyone stopped arguing. A short while ago, telecoms thought that the limit of the plain old telephone line network was 56k, but now HDSL is here and can deliver up to 8Mb/sec on an ordinary phone network. Who says that such technology couldn't be developed for amateur radio. Sure you can't buy that gear, but if hams got together and cooperated they could do it!

I don't know your particular situation, but I had the impression that
earthquakes usually occur along the borders of tectonic plates and as
such, the disaster area can be quite long, but that the damage does
not extend too far to the sides of the fault line.

Flooding is usually associated with rivers and also in this case the
disaster area is long but usually not very wide.

So in both cases areas of surviving infrastructure will be within VHF
or 3.5 MHz HF communication range. As important as it is to have
operators within the disaster zone, it is also important to have
operators just outside the disaster area who can relay the traffic to
and from existing infrastructure. Thus, these hams should be able to
set up a phone patch or set up a node or BBS that is connected to the
internet. In such situations the store and forward type of operation
of a BBS can be quite useful.

Regarding the situation in a previous message that it took several
weeks to re-establish phone connections after the California
earthquake, nowadays the phone companies would not even try to quickly
repair the broken phone cables, but instead install cellular base
stations on surviving buildings and use radio links to get the traffic
out of the area. Installing a new base station is a quite quick
operation.

Yes, we, W2SE. (10-70 Repeater Association, NNJ) will be running a
digital station on PSK-31 and RTTY for the entire contest. It will be
on what ever band that there is activity. Most likely 20M during the
day, but 10 and 15 will be watched. And 40 at night.
At this time we are only planning one station on digital so it will
roam about the bands.
The software will be TrueTTY as it does both modes.

"David Findlay" wrote

> Is anyone here actually interested in stopping fighting and actually building
a
> non-commercial network to compete with the internet?

First of all, it's not fighting.

"Compete" probably isn't the word. There is room for an alternative as you
describe.

> It would require a whole new suite of protocols, but could include a
> www. People could have their name or callsign as a domain, followed by three
> letter country code.

The .com .mil .org .edu and .net are all rather redundant in Ham radio, so
rather
than countries as a domain, you really only need one domain callsign.something
where something is what you decide to use (.ham .ars, etc). There is a Ham
domain already called ampr.org (amateur packet radio) but it uses the current
domain space. The only way that your new network can succeed is if the two
domains are kept seperate physically. If a person can route over the commercial
domain, and bypass the Ham domain, you will never expand the network.

> The main barrier that I think your network seems to have had is speed.

Bingo. Speed is 75% of the problem, the other 20% is the people, and the
last 5% is legal. We just recently were given access to modern technology
on the Ham bands. Before, you had to do everything with what was
designed before 1985.

> If you could compress the headers down to just what is required to get the
> thing to work, and increase the speed of the links to 1mb/sec it could be a
> viable alternative to the internet.

Yes, alternative to the Internet. The only way things get done historically,
is that a Ham or club will show a solution at Dayton, or in the Ham magazines,
and hundreds of other Hams are excited by that.

> Educational and scientific users could benefit greatly. Say a uni wants to
have
> a network of seismographs they would just have to link them to the network
> and they could have free access to them.

The uni operates mostly with Government and State grants. What you propose
would actually be broken down into several Masters and Doctorial levels for
partial fullfilment of their degree's, and take 10 years.

> It would require some central group to allocate IP numbers/domains, but it
> could be done if everyone stopped arguing.

Study up on IP Version 6. With 6, there is no need for a group to allocate,
as you can use the Ethernet MAC address (48 bits) as part of the 128 bit
IP adddress. Cisco should be big into this by now, I know all of my AIX
boxes at work do IPV6 now.

But! Do you really want to use IP, or do you want to design a real
alternative? Think of something better than IP. Remember, you are
wanting to design something with new protocols.

> A short while ago, telecoms thought that the limit of the plain old telephone
> line network was 56k, but now HDSL is here and can deliver up to 8Mb/sec
> on an ordinary phone network.

In the past people wanted symetric speed, while today they want speed
mostly one way. Consumers want it down, providers want it up.
Thus you can take a T-1 line (ordinary phone network) and run it with
an unsymetric speed. Actually, as I understand it, you can order a "dry"
drop of a phone line from one place in town to another, and pay only $20
a month for each site. Then using DSL modems at each end, you get
unsymetric speed levels based on line-length, and there is no switch in
the middle. Just twisted pair direct.

> Who says that such technology couldn't be developed for amateur radio. Sure
> you can't buy that gear, but if hams got together and cooperated they could
> do it!
>
> David Findlay

You have to start out smaller than a worldwide newsgroup. You need to
solicit members who can brainstorm the different parts of what you need
to get where you're going. If you try to brainstorm here, you will get
mostly ideas from 15 or more years ago. While it's true you need to have
a concept of all the networking basics (terminology for one thing), the
real fun is in the experiments locally. When people put netroms together
at 1200 baud, it was fun, it was Now. They didn't care that it would
eventually collapse upon itself (as theory and networking books suggested).
But when it did, it was only then that they could go to the next level
(and higher monetary outlay) that they all petered out.

The thing to investigate for study, is the microwave channels on the P-3
satellite. It's been hopping around in pre-launch the last 10 years waiting
for a ride, but if it ever gets airborne, it will be a big repeater that covers
the whole country. Hopefully they will have some data channels set aside
for new experiments.

Go out and try to find 10 antenna sites of 200 feet or more. It is very
difficult today. LMR (Land Mobile Radio) is shrinking as technology
expands. What used to take 100's of radio sites, now is done via
leased-line and satellite terminals. Ham radio must go the same direction.
The Cell-Phone types don't put up anything higher than 99 feet, so they
don't have to have a light on top. 100 foot doesn't have much of a

line of sight when you consider all the propagation zones.

Just my meek opinions.

Steve

>has any body used a normal internal or external commercial modem
>for packet ....???

By "normal internal or external commercial modem", I'm assuming that what you're referring to here is a regular dial-up telephone modem, and not some kind of radio modem used in commercial services (ships, airplanes, etc.).

None of the modes used by dial-up telephone modems are compatible with packet-radio modems, with the exception of the 300bps Bell 103 or v.21 mode. Even the telephone modem's 1200bps mode - Bell 212 in North America or v.22 (?) in Europe (not sure about that one), are not compatible with packet radio's Bell 202 mode (the packet and telephone protocols use different modulation methoods for 1200bps). The telephone's 1200bps mode would probably work OK over the air, though, you just wouldn't be able to communicate with other packet stations. (Might be useful as a secure inter-node or forewarding link.)

Although the telephone's 300bps mode is compatible with 300bps HF packet, the phone-modem mode uses separate audio frequency pairs for full duplex communication between the originator and the answerer of the call, so the modem would have to be modified to transmit and receive on the same tone pair in order to be compatible with packet. I believe this could be accomplished using the telephone modem's loopback setting, though. Then, all you'd have to do is hack into the modem and separate the transmit and receive audio paths (somewhere around the telephone-line coupling transformer) so you could gain access to the proper circuit paths for your microphone and speaker or discriminator connections. Are you sufficiently discouraged, yet?

Another issue to take into account is the fact that external telephone modems and the "BayCom-style" packet radio modems do not use the same pin assignments on the serial or "com port" connector. For example, the BayCom packet format uses the Clear-To-Send line for receive data instead of the com port's RXD line. You'd either have to hack the

modem's wiring to its serial connector, or use a special cable. You would REALLY have to hack up an internal modem, probably have to do some re-wiring to the UART. Probably more trouble than it's worth.

> is so will you pleas tell me the commands to
>allow it to be used as a straight thu modem like the old ones used
>to be .

If you're asking about defeating the Hayes-compatible AT-command set, I know of no way of disabling that function in a modem. You obviously would not have any way of sending an AT-command string to a modem after its serial connections have been modified for packet. You *MIGHT* be able to set the modem to Bell 103 with loopback and then program that as the modem's default settings using AT&W0. You wouldn't be able to ATZ the modem at the start of each session, but modems normally come up with the default settings at power-up. If not, just re-initialize it (turn it off/on). I haven't tried this.

I have obtained two Bell 202 telephone modems at an Amateur Radio flea market. They are Universal Data Systems 202T models by Motorola. Bell 202 telephone modems are quite rare, primarily used in industrial or retail applications (remote telemetry, re-ordering stock, etc.). The ones I obtained had a two/four-wire telephone line selector on them, so it was easy to separate the TX and RX audio paths (just run in four-wire mode). I added a reed relay for the push-to-talk line, and hacked the connections to the back of the serial connector to accept a standard serial cable when running BayCom. Nice to have all those status lights operating on packet just like when using a telephone modem, and it looks a lot more professional than having those kit or homebrew BayCom boards hanging off the serial port of the PC.

There was also an article on this back in the 80s in 73 Magazine. (I couldn't find it at the time of my experiments, so I came up with my own methoods, though).

I've picked up several of those pre-Hayes 300/1200 bps telephone modems at Hamfests. My next project is to figure out those dip-switch settings - if I can set them to Bell 103 loopback mode, it'll be fun to see how they compare to the AM7910 BayCom modem on HF.

I've always wondered if 9600 or 14400 bps telephone modem modulation could be used on a two-way radio link without corruption using a BayCom-type serial hook-up. Same interface requirements as normal high-speed packet of course (no simple speaker/mic connections at the radio) but it's definately on my "stuff to try" list.

>Stewart

It's amazing how often ths phone-modem-to-packet question comes up. Maybe someone oughta start a FAQ...

2647. Packet Gateway/BBS Help

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-06-19 00:00:00 UTC
From: Bill and Tracy <tmbc@nf.sympatico.ca>
Message-ID: <nqp35.106555$uw6.2037299@news20.bellglobal.com>
Source record: 12183
Cross-posted to: rec.ham-radio.packet,rec.radio.amateur.digital.misc

I am trying to setup a packet gateway/BBS for my area. Here is what I have to use;

P133, 32MB Ram, 850MB HD, NIC
386DX25, 8MB RAM, 200MB HD, NIC
2 VHF radios
1 UHF radio
1 Kantronics KPC-9612 TNC
1 Kantronics UTU-XT TNC
1 PacCommTiny 2 TNC
My Internet connection is an ADSL connection running DHCP. I can connect both PC to the internet via DHCP.

I have a fair amout of experience with computers, mainly DOS/Windows, so I think I understand the basics. I was wondering if anyone could tell me the best and easiest way to setup my gateway/BBS. Should I run DOS, Linux, JNOS, TNOS, FBB, or etc... I would like to setup a TCP/IP gateway, a full BBS, and possibly a DX cluster. I thought I would run 9600 baud on UHF and run two 1200 Baud nodes on VHF. Any info or thoughts would be appreciated. Thanks for your help.

Again, I am unfamiliar with foreign laws, but in the USA a patent
does not prohibit an individual from copying a design for his/her
own personal use. All it does is prohibit someone from commercializing
on the design, surely something no amateur radio operator would be
guilty of. 73, Cecil

On Mon, 19 Jun 2000 15:41:45 +1000, "David Findlay" <nedz@bigpond.com> wrote:
>
>Does any documentation on this network still exist online?

The best source of documentation is the collection of Digital Computer
Network Conference Proceedings published by TAPR and the ARRL.
In those 18 or so volumes you'll find that nearly everything you've mentioned
in this thread, and much more, has been tried, analyzed, and mostly been
found wanting for one reason or another. There's plenty of detail, plenty of
documentation of the nature of the radio environment (hidden terminal
problems, exposed terminal problems, multipath, noise, legal proscriptions
on bandwidth or content, site acquisition problems, routing in a sparse
network, etc, etc, etc), and the amateur radio social, demographic and
economic environments, and how they have shaped what is feasible with
regard to amateur radio digital networks.

Hank makes much of the old message passing system of BBS's loosely linked
together by various tenuously maintained slow radio links. But it was never a
network in the sense you or I (or anyone else seriously connected to networking
in the last 10-15 years) mean when we talk of digital networks. It is most similar
to the old dial up uucp usenet distribution, but with the dial ups replaced by less
reliable and slower radio links.

The sort of real packet switched end to end digital network that you or I would
mean when speaking of digital networking has only existed in amateur radio in
a few limited areas where careful network engineering, and a hell of a lot of hard
work and politics, have been practiced to get it built and maintained. Technical,
social, demographic, geographic, and economic factors have prevented any real
amateur radio digital network from expanding to become the worldwide network
that Hank would lead you to believe once existed.

There are basically three ways we can go from here. One way is to throw up our
hands and abandon the idea of amateur radio in the context of digital networks
altogether. Most everyone posting here (with a few exceptions) eschews that
solution. We all want to do digital radio of one sort or another, and many of us
would like to do at least part of that in a networked manner.

A second way is to cling to the past and try to rejuvenate a message passing
system that was already an obsolescent concept in the days when it was
most active (then rail at amateurs because most of us don't want to do that
again). That way is a dead horse. It isn't going to come back to life on any
sort of major scale.

The third way is to concentrate on what is feasible within the amateur scope.
That includes moderate size medium to high speed radio LAN structures. It
is practical and feasible, albeit a lot of hard work, to build and maintain packet

switched radio networks of metropolitan scope, and in some cases of a somewhat larger scope, which have a reasonable degree of performance. (The biggest amateur network of which I'm aware that meets the criteria for a modern end to end packet switched network spans parts of four states. It is pretty much as large as it will ever be because amateurs are too thin on the ground to expand it much further while keeping it coherently linked and reliable.)

If there is a need to intertie these networks with other networks (and there often isn't a good reason to do so since a metropolitan scope is often sufficient for amateur purposes), we will need to use whatever means is practically at hand to do that part of the job, because we aren't going to be able to do it purely by amateur radio. We're too thin on the ground, and don't have the financing or the number of skilled amateurs to put up and maintain the necessary infrastructure for a pure radio packet switched digital network on a national or international scope.

(It is possible that we can do something that is very low speed, and/or very high latency, on a large scale. That sort of network might fill some useful niche. But we aren't even in your wildest dreams going to construct a viable alternative to the wired internet on a large scale. There are too many miles and too few amateurs.)

This is all fairly old ground. It has been chewed over here and elsewhere many times, often in much greater detail. I found myself alternately chuckling and grimacing while reading some of your suggestions. You haven't been there yet, but a number of us have trod that ground, and in many cases found out the hard way what works and what doesn't in the amateur radio context.

Most of the technical issues have viable solutions, though those solutions are often very different from what works in the wired world because radio propagation in the real world is very different from a wire. It is the demographic, geographic, economic, and political issues that are the hard problems. For example, give a thought to the fact that most amateurs reside in the metropolitan areas, and there are wide expanses between metropolitan areas where there is little or no amateur presence.

Who is going to acquire the sites, build, and more importantly who is going to maintain, the links needed to cross those expanses? It isn't feasible to expect amateurs to drive for hours, time and again, year after year, to maintain a link out in the middle of nowhere. (Some of us did it back in the beginning, but it burned virtually all of us out in the end.) Amateurs have lives and other obligations. The reality is, if you don't have a local presence, you can't maintain a reliable link site of even medium performance over the long term.

That means there are going to be many situations where you just can't get there from here via packet radio, because the necessary links in between either don't exist, or are down. (HF isn't a viable alternative, it is too slow to handle the sort of volume a metropolitan intertie, much less a national or international trunk, would be called upon to support.)

If we scale our expectations to the feasible, there is still a lot we can do with amateur radio digital networks that's desirable enough to attract a sufficient

following to support it. But don't be fooled, national and international scope amateur radio packet switched networks aren't part of the picture.

HAM radio used to be about communications and fun. The
"communications" part now is normally handled better
by other means such as Internet. The "fun" part is
still there, for those who like it.

> > Seriously:
> > People who try to network (or just link BBS) narrow-band

>
> Of course. Just shut down any ham radio activity you
> don't like.

I think his point was - there's no real sense or purpose
in usin narrow-band radio for communicating graphic info,
except for having fun. Because if what you realy want is
getting that picture [as opposite to playing with your
rig, when picture is a side-effect/proof of successful
playing] - much better ways are available.

> Funny, some of us like to do things you don't like to do.
> For example, long haul data transfer on HF.

Look, it is fun, but [in normal conditions]
it is not practical.

So rather than being on the "leading edge" of
communications development, this data hauling
(no pun intended :-) is just one of a bunch of
hobbies some people take.

Are there any web pages where I could listen to samples of the various digital signals I hear on HF? (I'm already familiar with fax and sstv.)

Are there any programs available to decode any of them with a PC soundcard (aside from the two mentioned above)?

Is there anything worth decoding by anyone other than the intended recipient?

Airboy??

The concept of troposcatter is very well know. Not so well
known (at 2m anyway) is ducting (hugging the Earth as it
curves). It doesn't go through the Earth. 2m is a great radar
band, and a very popular Russian export.

Even a short time on 2m will get you all sorts of A.P.
(Anomalous Propagation) effects, as you play with it.

You have to get out of the FM repeater slices to enjoy it.

Did you have trouble parsing "troposcatter paths" in my posting?

Rob:

In the USA a patent does not forbid you from building an implementation of the patent for your own personal use, in fact that is specifically allowed under patent law.

In theory the patent "teaching" is supposed to give you enough information to be able to do just that. If there is not sufficient information for you to build a working model and this can be proved then the patent is invalid!

If you could show to a court with appropriate jurisdiction, and to it's satisfaction, that there is not enough information in s patent for a person skilled in the art to construct a working model then the patent may be declared invalid.

The point is patents are supposed to "teach" and reveal all necessary information to construct a working model!

What you are forbidden to do under patent law is to make a business out of it by building patented inventions and selling them to others without the specific permission of the patent holder/assignee.

The difference is that DES is intended to obscure the content of the transmission and you have to have the key to decode it. Pactor-II is not intended to obscure the content and no key is needed to decode it. That's the whole point of the regulation - to prevent the use of any technique to encrypt or obscure the content of the transmission. The regulation is *not* intended to prevent the use of protocols to enhance the transmission or to make sure that only "open" non-patentend protocols are used.

2660. Forget HF & CW - Think Digital

Phoey on the ARRL and TAPR, it is time to start making our own hi-speed digital communications network by working at the grass-roots level. The tools are there, all we have to do is start building...

Here is a How-To:

http://www.gbonline.com/~multiplx/wireless/

A modern hi-speed digital station is much cheaper than an old TNC-based packet station used to cost!

HF and CW are lame. The vast majority of technically-savvy young people could care less about them. We have to move past the CW debates and start implementing a digital network. Most digital RF experimentation is now being done by non-hams. Since we have less restrictions than the Part 15 devices, we should be able to get some of the bright, young people to take interest in the hobby - but NOT if we continue to over-emphasize HF and CW.

> designed before 1985.

NASA is developing a new protocol for interplanetary internet which uses much smaller headers. They can't afford to waste all those bits for headers. So maybe a similar simplified header could be used on a new protocol.

> Yes, alternative to the Internet. The only way things get done

But it could be added to their existing gear and make it easier and cheaper to monitor.

I have. I'm doing a Cisco Certified Network Associate course.

> But! Do you really want to use IP, or do you want to design a real
> alternative? Think of something better than IP. Remember, you are
> wanting to design something with new protocols.

I would rather develop a whole new range of protocols suited to radio. This would include a compressed version of HTTP which could save bandwidth on the network. Would MAC addressing be needed? Couldn't we just stick to logical addressing. A certain address prefix could be allocated to each country. We would also need routing protocols as well. Also it would be good to have some sort of positioning system that could give you your location based on ping times to various stations.

This wasn't what I meant. What I meant is that if such technology exists for phone lines, we could develop similar stuff for radio.

> You have to start out smaller than a worldwide newsgroup.

I know. I had a look at the aus.radio.amateur.digital newsgroup and they only seemed to have three regular posters, and one message per fortnight. So I came here so I could get some answers.

> (and higher monetary outlay) that they all petered out.

I will get my liscence in a month or so. Then I will build my gear. I am going to see if I can get the Brisbane Storm Chasers group to join because they would have a real use for it that would get it off the ground. I am going to establish an automatic weather station and lightning tracker system that would be accessable via the network. This would be of use to them, because it would allow them to get the data while they are out chasing, instead of having to use mobile phones. I also know that some of them are Hams so they would be interested. Once I get it going around my area, we could start extending the network.

No good for me. I'm in Australia. I need one in geostationary orbit above the pacific, then I could transmit to the USA. Maybe if the network takes off, someone will put one up for the task.

Use lower frequencies. Then we might be able to get enough skip to relay signal from router to router across the country. If we had a high enough density of users in a urban area you could still use VHF and then use sat or HF for the long-distance links.

Have you ever heard of troposcatter ?

We have four hour VHF/UHF/microwave contests on Tuesdays evenings and
looking at the results from the last few months, there are at least
ten stations in each category with longest QSOs in the 300 - 800 km
range on 2 m and 70 cm, on the microwave bands there are a few
stations in that range, but the number of participants are quite low.

This is definitely troposcatter and not tropospheric bending. The
signal can quite often contain deep QSB, apparently due to multipath
due to multiple scattering paths taking out the signal as in selective
fading. Multipath also means a lot of phase reversals, so I very much
doubt that PSK31 is suitable for troposcatter. It might be better to
try a wide modulation method (with low net data rate) in order to
combat the fading.

```
==================================
ANNOUNCING <APRSdec>TM Version 2.0
THE FULL APRS DECODER PROGRAM
by Ian Wade, G3NRW
16 June 2000
==================================

<APRSdec> version 2.0 is now available. <APRSdec> parses APRS packets in
TNC/IGate output format or UI-View log format, producing a full decode of every
data element in each packet.

<APRSdec> is a particularly useful tool for:

o APRS software development and testing.

o PIC development and testing.

o Network fault-finding and diagnostics.

o Learning about the APRS protocol.

o Checking packet formats.

<APRSdec> version 2.0 is a significant enhancement over earlier versions. It
has much improved error checking, and for the first time is provided as a Perl 4
source, allowing it to run on most platforms including DOS, Windows and Linux/
Unix.

<APRSdec> is made available under GNU General Public License.

<APRSdec> is a trademark owned by Ian Wade, G3NRW.

==================
<APRSdec> FEATURES
==================

o Runs under native DOS, Win 95/98 and Linux/Unix. (It will almost
certainly run under Windows NT and Windows 2000 as well, but this
has not been tested).

o Accepts raw input in TNC/IGate output format (TNC_header:data).

o Accepts raw input in UI-View 2-line log format; it is no longer
necessary to edit log files before using <APRSdec>. In addition,
as well as decoding APRS packets, <APRSdec> also decodes the 15-digit
UI-View timestamp.

o Performs rigorous format checking, with detailed error reporting.
```

o Understands position ambiguity, reporting the bounding box in which
the station is located.

o Compares lat/long position against a prefix/country database -- if
the station's position appears to be outside the country, <APRSdec>
reports a possible anomaly.

o Reports data values in imperial, nautical and metric units.

o Fully decodes Mic-E and compressed position formats.

o Recognizes data from Kenwood TH-D7 and DM-700 radios, and changes
the incorrect DM-700 APRS Data Type Identifier to "Current Mic-E Data".

o Provides detailed weather station reports, including the calculation
of windchill and dew point.

o Decodes storm data.

o Decodes bearing and range data.

o Decodes DX Cluster reports, showing the data as it will appear on TH-D7
and DM-700 screens.

```

I don't think they carry QEX at the local Barnes and Noble, but I'll
check anyway. I went to the ARRL's QEX site, but they don't have an
article index. What does the latest issue(May/June?) contain?

Hopefully they're petitioning to expand 40meters down a little. I'd go for
that.

Don't be silly. Why would you want to build your own gear? How can
you compete with a commercial company mass-producing a $120 RF network
card? And these prices will drop as more companies compete for your
dollar. Where we CAN do are own work, and where it makes a BIG
difference, is with the antenna and feedline.

No Way, Jose - We now have the Internet! It is AWESOME, and we need to
use it as a backbone. All you have to do is hook up stations to Linux
gateways hooked into the Internet thru super hi-speed, super cheap DSL
and Cable Modem connections.

I don't think we are ever going to agree on that one. I think you have more fun and learn more from building it yourself.

No way. What we need is a totally independant network. The internet is too slow. If I can get my gear working we could have 10Mb mobile in any populated area. Okay so we would need email and news gateways, but lets do something that doesn't rely on the internet.

You may think that it is more fun, and it certainly is, but most people
will ask the question "what is the cost?" as soon as you have finished
talking about all the potential fun.

AT least, that is the situation here. But then, our people have the name
to be like that (after the Scots, maybe).

>> No Way, Jose - We now have the Internet! It is AWESOME, and we need to

Hmmm... high speed is not really an attribute that most people would
assign to amateur packet radio... (understatement of the month)

I have done mobile packet, and it was fun. But not at 10 Mbps. When that
works it will probably be a lot of fun, but I doubt that you can make it
working...

When you want to have fun, it is better to first try that weather satellite
project. That gives a lot more fun for the effort and cost!

Wow - 20wpm, I'm SO impressed. And you write it down on a piece of paper with a pencil, right? And you are at the mercy of Mr. Sun, who just happens to be in an upbeat mood right now.

When you start to realize that reliable worldwide 100,000wpm transfer rates are now available to just about everyone, you might start to understand why CW is such an anachronism.

The above is a classic non-sequitur.

Amateur radio is an avocation, and Morse operators are a special
interest group within that avocation. In the context of that
avocation, they aren't concerned with high speed data transfer,
just as equestrians aren't concerned with travel at supersonic
speeds.

If your interests are in high speed data transfer, then Morse is
not for you.

Have a nice life.

Stewart:

More foolishness. CW is digital, and a very good digital mode at that!

Only 20 wpm... Heck I myself can "run" at close to 45 wpm on both send and receive, and well...

Who says that only human beings write down and send CW.

At high speeds [100 - 1000 wpm] most folks today are using computers to send and receive CW. Have you not listened to them copied them on your computer?

CW is a great digital mode! It has many modern features and capabilites.

It has built in source coding [a.k.a. data compression]. The source code it uses is a variable length comma free code which works on a character by character without Markov modelling, just like the Huffman coding in Peter's Martinez's new PSK31 technique.

And of course... if coherent or "near coherent" channel coding techniques were widely used as some already do today, then at the channel coding level it is extremely efficient and compares to the other "so-called" modern digital modes as well.

The inventors of Morse and wireless telegraphy were way ahead of their time!

CW is literally the only purely digital mode that is 100% readable by both machine and human. If it is sent too fast for humans, it can be simply slowed down and played back for the human to read. Try that with Clover, or PacTor, or RTTY...

If the point you are trying to make is that humans should not have to learn the skill, and prove that they have the skill, to copy CW to qualify for an amateur radio licence to operate on the HF bands, then I can agree with that, but...

as for the CW mode not being digital and being "outmoded", you are "dead wrong"!

And so...

Fools... What the heck is your beef?

Comments, thoughts?

Yes, I should have been more precise.

The why is that the guy who is doing this is connected with a TTY
museum, and is trying to bring back something for RTTY SWLs to copy
as existed back in the 1950s. At least that's my understanding.
Probably his website www.rtty.com has a better explanation.

Because Aviation regulations are dictated by practical
needs, while Amateur regulations reflect traditions
first, and needs second.

On the other hand, some pilots learn to fly really old
and very much obsolete airplanes - 'cause they're having
fun with 'em...

Don't you see that EVERYTHING that HAM radio has today
(and is likely to have in the near future) is dead from
the practical/high-data-rate point of view?

Or are you planning to deploy 1+Gbps wireless...? If so,
you might successfully compete with Internet-2 (:-).

Laura:

Hello, nice to meet you here. Sorry to see that a progressive young lady like you is also misguided!

I think the other participants here on this thread do not have a valid point. They say forget "HF and CW", but what they really mean is to forget HF. This has nothing to do with CW. They are merely trolling for OT's to tease and annoy!

Incidently I agree with that lesser statement.

"Forget HF", I am avidly involved in broadband local communications myself. You???

There are is well excess of 1GHz of valuable spectrum set aside [mostly on a secondary basis] for amateurs to use from 144MHz to 10GHz.

I listed these frequencies, band by band, and totaled the spectrum, in a recent posting to this NG. Check out deja-news for the archive of my postings. Ask Charles Brabham here on this NG...

That whole Broadband spectrum could well be put to use and re-used and re-used geographically by us amateurs for interesting and compelling broadband communications. Why not? What are you doing to help? Just torlling for OT's on a NG. Heck, get busy do something useful!

I'd like to know who among our ranks is doing something about filling up that spectrum? Possesion is 9/10 th of the law as they say. Use it or lose it! Certainly not the folks who hang around here trashing CW and baiting OTs.

BTW if we don't fill up that spectrum with something [I prefer free local broadband Internet access for amateurs] the governments around the world will sell it out from under us.

Get moving, gal!! To hell with HF get onto UHF, and uWave's with compelling broadband projects.

And.... leave poor old CW alone, it is the most efficient and one of the most modern digital modes in use on that narrow old useless HF spectrum.

CW or some simple derivative could easily be run at GBps rates for local computer communications on the uWave bands and help to fill them up.

Y'all's comments on CW show that you know almost nothing about "digital"! CW is digital and it embodies most of the modern concepts of source coding

and channel coding into its ancient methods. Jeesh!! You guys probably don't even know the difference between source and channel coding! Digital people, har, har... wake up and do something!!

If any of you did know about digital maybe you could do something with the UHF,SHF, uWave frequencies, but y'all don't, so there!

Thoughts, comments...

One of the real big problems with digital other than CW,is that
digital often uses packets to transmit information (Cw does not).
Sometimes CRC codes are transmitted via digital. If the error rate
gets too high, it could entirely stop communications. IF there is
an error in every block, using ARR, you might never complete sending
an entire block.

In the early days of computer networking (especially WANS and
remote networks), these errors have completely stopped computer
systems from working. In washington, there was a remote connection
between Everett and Pullman in the mid 70's that I worked on.
At times, the phone lines (we had a conditioned 9600 baud) were
so bad that we could not use this system.

In additon to bandwidth problems, digital is just only one of the
options available to hams, not the only one.

Actually, a reliable 1200 baud packet network would probably be sufficient for most emergency communications. One of the downfalls of the packet network was that it was completely overloaded with a multitude of unnecessary, uncoordinated BBSs that sent the same messages to each other over and over. I used to send traffic between the east coast and Michigan. The latency was several hours to several weeks and about 50% never got through at all. If you want to build a reliable wide area network at any speed, the first thing you need is coordination. I'm not sure you can do that very well in a volunteer organization where everyone wants to "do his own thing".

I don't know if you are aware, but TAPR is pretty much dead. The new
site is www.dandin.com as Dewayne found them all a job. It looks like
they specialize in getting Government grants as an 8-A company.

You can tell how much Greg was behind all the Web site, because since his
resignation it has become a purely static shrine. Nothing gets updated
anymore.

You could probably win both BoD membership and the Presidency if
you were to run, as the other members are mostly silent and show up
for any voting requirements, but that's about it. To look at the Web site,
none of the other members do anything useful if that is the evidence.

Stewart:

[snip]
> You don't get it, do you? All you have to do is connect to the dude
> with a DSL gateway down the street, and you can talk "all over the
> world" - even on 2 meters.
>
> Stewart - N0MHS
[snip]

I beg to differ.. You don't get it!

Three things...

First:

There are less than 200,000 DSL lines installed in this country as of 6/2000 [not counting HDSL a.k.a. T1]. And... there are a grand total of 160,000,000 access lines in existence. A current penetration of 1/4% of all lines! At the current growth rate, when will they get to me, you, Bob, Ted, Alice, etc...

Second:

Approximately 30% of those access lines are served from Digital Loop Carrier systems which are currently incapable of carrying significant penetrations of DSL when they do at all! Approximately 30% of the remaining lines cannot support DSL because of load coils and bridged taps on the loops.
Most of those DSL lines run at speeds of only around 384 kbps or less!
Bummer!

Third:

The large majority of the current DSL lines are running at speeds of 384 kbps or less!

And so...

Where is the wireline broadband access for the rest of us?

Now if we hams really made use of the broadband spectrup allocated to us to do amateur radio wireless broadband local loop access to the Internet, why then we could eliminate the World Wide Wait, at least for hams...

Now ... you just don't get it. What are you doing about it? Reading threads on HF & CW.... fool!

Get out your design manuals, soldering iron, compilers, and get cracking....

At the current rate and with the problems out there DSL won't be at most of our places for at least the next decade. By then we can have taken over the world with free amateur radio broadband access.

DO SOMETHING, don't just sit there typing criticisms into this dang NG thread!

Lets see now - you're using several thousands of miles of phone line and 2 blocks of 2 meter link. You're not using 2 meters to talk all over the world, you're using phone lines. People have been talking "all over the world" with phone lines for a long time now. Believe me, it's nothing new. The only thing new is that it costs less now and you type on a keyboard to send your message across the phone lines. Next someone got the bright idea to hook a microphone up to the computer so he could actually "talk" over the phone lines. Gee, didn't some guy named Bell do that a number of years ago? And what happens when the dude's gateway crashes or his power or DSL line goes out? You can't talk anywhere - unless of course you happen to have an HF rig standing by.

Redeem? The public mostly doesn't know radio exists. Rather than
using technology to secure their radio-phones, they created a law against
listening instead. Sorry, you can't redeem anything where all the stores
are closed.

> And, this could be done with modest investment by Joe Ham, using 70cM, 1

While CW is indeed an on-off code, when people talk about digital modes they don't generally mean CW. Except in ARRL publications.

CW works because it is fundamental. Which is all it needs to be. If it works for you, use it. If it doesn't, don't.

I find it kind of fun - it reminds me of Aimee listening intently in her headphones, terrified the detector vans are going to find her before her sked with London is finished (yes, they just reran that show here...an oldie, but a goodie).

Ah-ah-ah, but it DOES affect me in that an ARS license structure that does not reflect modern-day reality, because it places too much emphasis on HF/CW, rather than UHF/digital, depicts the ARS as a backwards-thinking group of individuals, who are not interested in modern communications methods, or in attracting young individuals to the hobby.

Well, I gotta jump in on the side of Hansl on this one.

If, as you proclaim, you are interested in UHF/digital, then there is a
license class (Technician) which gives complete access to UHF/digital
operations and has ZERO emphasis on CW or HF. Your poking and
strirring is completely specious, and simply brands you as a Dump Huck
troller.

And that's the way it is!

Tweedle tweedle, dit dit.

Well, I searched and I searched and I searched and nowhere in Part 97
does the FCC call Technician the LOWEST license class. It does not
in any sense emphasize CW or HF for UHF/digital operation. Hansl is
right.

And that's the way it is!

Say what?

I'd hate to think the vast sums of money I've spent on university
education, playing around with various modes, and so on, were
wasted. And my employers (Glenayre) would be shocked to learn
that I apparently know nothing about digital communications.

Personally, I think ham radio's preoccupation with narrowband
modes is silly. I think everybody should be on 10 GHz - 500 MHz
of spectrum to play with, dead easy to use, dirt cheap to
get going.

I don't see that. The license structure has a CW test (for the higher classes) and it asks theory questions on digital (packet) too. What it comes down too is that for the TOP license, one must show at least some familiarity, if not proficiency, with all modes (even those one CHOOSES not to use), and that is proper (since one CAN do everything that's allowed). Those who don't care about CW or HF appear happy with simply holding a "technician" license (which doesn't really forbid any other operating mode), so, since there's a license that already addresses your view, exactly what is your problem? Where's the "CW emphasis" for that license class?

Those who want to do everything should be tested on everything. Those who don't can settle for the lower class license that covers what they want to do. What you haven't demonstrated is: What is there that you want to do that your current license doesn't cover but a higher class does?

Perhaps you want to know why you're getting such hostility? Perhaps you need to be clued in on the "Modern ARS." The code requirement for having an [entry-level] AR license disappeared in 1991; 9 years ago. However, it is self-evident that your personal perception didn't change then (or now).

Your comments about digital modes not being high speed is merely a LOCAL issue - other parts of the country [allegedly] do have 38k-56k or higher operations. In Southern California (where you are), we can't do what people won't agree on. You want to fix that? Try running for an SCDCC spot at the next election meeting (October). Conversly, then why isn't everyone simply a technician license holder? Why does anyone upgrade? All the next class up (general) really does is provide for HF access, which includes your dreaded CW - as REQUIRED by treaty (plus minimal volunteer examiner duties). Beyond that, all the extra class does is:

Give a few more kHz here and there, allow an amateur to put up a satellite, and become a VE able to administer ALL exams.

It's the lowest class because:
- It doesn't include the minimum required for the other classes
- It was what the amateur public said was needed 10 years ago to attract "new blood." (And was implemented NINE YEARS AGO.)

Try coming up with a statement that isn't 10 years old.

The only problem that you have missed is the question of ENERGY.
Worldwide digital communications over Internet "eat" many energy and
without AC power you can't run your digital network for a long time
while you can operate a ham transceiver with a little solar or wind DC
generator equipment and a car battery.

From another point of vue, look what happens when a single node is dead
on a "crowded" route of Internet: a part of the network is dead.

Of course CW is obsolet (all clever people know that for a long time)
but nothing will replace a "point to point" SSB QSO in case of worldwide
emergency because in some desertic locations on Earth, your digital
equipment has no chance to survive electronically.

One of the job of ham-radio operators is to maintain a VOICE network all over the world. High speed digital QSOs have no REAL interest for hams. For that they have (or will get soon) ADSL lines. For us, a TNC2 is enough good.

I think there is a four-node 56Kbps system in the Atlanta area(they may have more users than that attached to it). But each station setup costs more than $600. That is why WA4DSY technology never caught on.

Some dudes in Green Bay, Wisconsin have set up a network using modified inexpensive Part 15 devices - THIS is the way to go(see my web page for references).

Trying to make me old before my time, eh?

At the height of Amateur Packet Radio Network growth period('91-'94), and just before the crash, I used to go to those meetings regularly. Sometimes, more 100 people would show up. And you are right - THEY COULDN'T AGREE ON ANYTHING!

2723. Wake up TAPR!

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-06-23 00:00:00 UTC
From: horseshoestew@my-deja.com
Message-ID: <8iua4j$vk8$1@nnrp1.deja.com>
Source record: 12109
Cross-posted to: rec.radio.amateur.policy,rec.radio.amateur.misc,rec.radio.amateur.digital.misc

Inexpensive Long-Range High-Speed Wireless Networking is now possible. It is time for TAPR to drop the FHSS radio, and their "not invented here" attitude, and start educating people on how to set up high-speed stations and networks.

After years of development, it is evident that TAPR's 900Mhz FHSS radio is going down the path of TAPR's other infamous doomed radio project of the early 90's: The packetRadio. Worse still, many amateurs look to TAPR for guidance in high-speed wireless networking, and since they don't see any information coming from TAPR, they wrongly assume that high-speed networking is too difficult. With simple $120 Part 15 wireless networking cards available, who needs a FHSS radio that operates on a band where Amateurs are secondary users? TAPR needs to wake up, face the facts, cancel the FHSS radio, and start educating the public on how to build inexpensive high-speed wireless stations and networks.

TAPR's place in history is becoming tarnished...

Baud really is a telegraphy term, and it refers to a switching rate.
Words per minute is confusing become most low speed TTY is 6 level,
usually baudot, where as 100wpm and up is usually 8 level Ascii, which
with the requisite start and stop bits is 110 baud.

Baud does not necessarily mean bits per second. Technically 2400
baud is as fast as a phone line will go, beyond that it is bits per
second because it isn't a switch rate, the data is in fact transmitted
by phase modulation. At 110baud, the data is sent by frequency shift
keying.

Of course, but my point is that there is no incentive to upgrade
anymore, and that the structure still puts too much emphasis on HF/CW
vs. UHF/digital.

Well said!

The US ARS could redeem itself in the eyes of the public by establishing
a robust, disaster proof, transcontinental message handling service.
And, this could be done with modest investment by Joe Ham, using 70cM, 1
1/4, 2, 6, and 10M currently allocated frequencies and could be done
without draconian measures bulldozing existing modes off the bands. The
US ARS will never redeem itself by whipping Joe Ham into a self-serving
frenzy, chasing after the latest fad modes, greater throughput, and a
cheap dodge to a commercial common carrier wide-band system.
Unfortunately, the "Newington" ARRL leadership seems unable to manifest
the kind of vision that was inherent in it's past namesake.

Clay N4AOX

2731. What is APRS?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-06-23 00:00:00 UTC
From: Ian Wade <Ian.Wade@care4free.net>
Message-ID: <8CH5nXAwdwU5Ewbn@care4free.net>
Source record: 12117
Cross-posted to: rec.radio.amateur.digital.misc,uk.radio.amateur

Several people have asked lately about APRS. Here is a brief intro:

~~~~~~

====================
INTRODUCTION TO APRS
====================

What is APRS?

APRS is short for Automatic Position Reporting System, which was
introduced by Bob Bruninga, WB4APR, at the 1992 TAPR/ARRL Digital
Communications Conference. Fundamentally, APRS is a packet
communications protocol for disseminating live data to everyone on a
network in real time. Its most visual feature is the combination of
packet radio with the Global Positioning System (GPS) satellite network,
enabling radio amateurs to automatically display the positions of radio
stations and other objects on maps on a PC. Other features not directly
related to position reporting are supported, such as weather station
reporting, direction finding and messaging.

APRS is different from regular packet in several ways:

* It provides maps and other data displays, for vehicle/personnel
location and weather reporting in real time.

* It performs all communications using a one-to-many protocol, so that
everyone is updated immediately.

* It uses generic digipeating, with well-known callsign aliases, so that
prior knowledge of network topology is not required.

* It supports intelligent digipeating, with callsign substitution to
reduce network flooding.

* Using AX.25 UI-frames, it supports two-way messaging and distribution
of bulletins and announcements, leading to fast dissemination of text
information.

* It supports communications with the Kenwood TH-D7 and TM-D700 radios,
which have built-in TNC and APRS firmware.

Conventional packet radio is really only useful for passing bulk message
traffic from point to point, and has traditionally been difficult to
apply to real-time events where information has a very short lifetime.
APRS turns packet radio into a real-time tactical communications and
~~~~~~

display system for emergencies and public service applications.

APRS provides universal connectivity to all stations, but avoids the complexity, time delays and limitations of a connected network. It permits any number of stations to exchange data just like voice users would on a voice net. Any station that has information to contribute simply sends it, and all stations receive it and log it.

APRS recognizes that one of the greatest real-time needs at any special event or emergency is the tracking of key assets. Where is the marathon leader? Where are the emergency vehicles? What's the weather at various points in the county? Where are the power lines down? Where is the head of the parade? Where is the mobile ATV camera? Where is the storm?

To address these questions, APRS provides a fully featured automatic vehicle location and status reporting system. It can be used over any two-way radio system including amateur radio, marine band, and cellular phone. There is even an international live APRS tracking network on the Internet.

APRS Features

APRS runs on most platforms, including DOS, Windows 3.x, Windows 95/98/2000/NT/CE, MacOS, Linux and Palm.

Most implementations on these platforms support the main features of APRS:

* Maps -- APRS station positions can be plotted in real-time on maps, with coverage from a few hundred yards to worldwide. Stations reporting a course and speed are dead-reckoned to their present position. Overlay databases of the locations of APRS digipeaters, US National Weather Service sites and even amateur radio stores are available. It is possible to zoom in to any point on the globe. And since GPS selective availability has been switched off for good, GPS positions are now accurate to a few meters.

* Weather Station Reporting -- APRS supports the automatic display of remote weather station information on the screen.

* DX Cluster Reporting -- APRS an ideal tool for the DX cluster user. Not only is it possible to see all DX spots on the map, but by operating in the monitor-only mode, the overall packet load on the DX cluster is reduced. This is a benefit to everyone on the channel.

* Internet Access -- The Internet can be used transparently to cross-link local radio nets anywhere on the globe. It is possible to telnet into Internet APRS servers and see hundreds of stations from all over the world live. Everyone connected can feed their locally heard packets into the APRS server system and everyone everywhere can see them.

* Messages -- Messages are two-way messages with acknowledgement. All incoming messages alert the user on arrival and are held on the message screen until killed.

* Bulletins and Announcements -- Bulletins and announcements are addressed to everyone. Bulletins are sent a few times an hour for a few hours, and announcements less frequently but possibly over a few days.

* Fixed Station Tracking -- In addition to automatically tracking mobile GPS/LORAN-equipped stations, APRS also tracks from manual reports or grid squares.

* Objects -- Any user can place an APRS Object on his own map, and within seconds that object appears on all other station displays. This is particularly useful for tracking assets or people that are not equipped with trackers. Only one packet operator needs to know where things are (e.g. by monitoring voice traffic), and as he maintains the positions and movements of assets on his screen, all other stations running APRS will display the same information.

Where to hear APRS transmissions

One of the biggest attractions of APRS is that it only uses one frequency to work on -- everyone shares it. In North America, this is 144.390 MHz. In the United Kingdom and several European countries it is 144.800 MHz.

Where to find out more about APRS

These web sites have a wealth of information on APRS, including documentation and sources of software:

FSK = the RF carrier is moved over a certain offset to transfer 0 or 1.
no tones involved. the parameter is the offset between the frequencies.

AFSK = an audio tone is modulated on the carrier, normally using FM
modulation (when it is done using SSB, the result is the same as FSK).
there are two tones. for 1200 baud they are 1200 and 2200 Hz.

9600 baud is normally done using FSK.

You don't get it Stewart. Some people actually get a thrill out of working DX on the HF bands. Of course they realize that they could call them on the phone, or send them an e-mail, but that just isn't the same. No one is forcing you to do it. If you aren't interested in HF, fine. Does that mean no one else should be?

Cheryl at Kantronics wanted me to pass along she has come across 34 new GPS Trackers. They are $349.95 and can be purchased right now. Since supplies are limited, it's first come, first serve.

Contact Kantronics at sales@kantronics.com or call them at 785-842-7745.

There is a searchable QST and QEX article index at:

http://www.arrl.org/members-only/qqnsearch.html

If memory serves, QST has featured a "What's In QEX This Month" blurb for a while now.

When I use "DIGITAL" as the search word, I get 394 hits. 104 of them are from QEX. I think that Ed may have been speaking generally, rather than specifically about the May/June issue; the digital articles from that issue are:

May 2000 QEX 13 A Low-Cost HF Channel Simulator for Digital Systems Forrer, Johan, KC7WW

May 2000 QEX 4 Is Digital Voice Permissible under Part 97? (sidebar to Practical HF Digital Voice) Rinaldo, Paul, W4RI

May 2000 QEX 3 Practical HF Digital Voice Talbot, Andy, G4JNT

May 2000 QEX 3 Practical HF Digital Voice Brain, Charles, G4GUO

I note that you are not an ARRL member and apparently don't subscribe to QEX. On what basis are you able to "fooey" all the stuff you haven't seen?

I don't know how your grass-roots movement is coming along, but if you can put together the documentation for a high-speed UHF digital system that hams can duplicate, I bet the QEX editor would be interested. If it is published, I could then ask that it be linked off the ARRL TIS page at:

http://www.arrl.org/tis/info/digital.html.

I am in the process of adding the HF digital voice article and the link that you gave in an earlier post. Any and all suggestions for improvement for

that page are welcome.

Yes. I appreciate all that. With Baudot the extra half element in the
stop bit complicates it further.

If you can liven things up, and help take Hams forward (and get them interested again), by all means go for it! Packet was once a lively mode where I live, but folks have drifted away. We lost W5AC's BBS because no one seemed to want to take care of it, and it was a Rose Switch as well. Then we lost W5XO, as he was trying to keep things running, and no one wanted to cooperate. Now, the closest thing to me is in Temple, Tx. or Houston, and both are a bit too far to hit from my QTH. Seems there should be some way to get some of the activity back.

Packet is dead where I live too. 5 years ago it was JUMPING, lots of
BBSs around, you could find a live qso, etc. Now? The only action is
the local packet cluster and APRS. Sad. Packet was fun.

LinKT works fine on RedHat. You need to get the sources and
compile it yourself. SuSE just includes binary packages of
LinKT with their distribution while other vendors don't.
We do not make packages for any distribution, we just offer the
rpms made by SuSE for download. Perhaps it helps to ask RedHat to
package hamradio software as suse does.

For now, get linkt-0.6.2.tar.gz, untar it and run
cd linkt-0.6.2;./configure;make;make install

Hope that helps.

I have a receive fault on my PCPA type 2 (DRSI) card. Port 1 works perfectly. The fault is on port 0. TX works ok but even though the RX LED lights there is no RX data to the PC.

I have tried the loop-back tests, using the THS program, with the same result. I have also tried adjusting the RX sensetivety with no effect.

I have tried to find Siskin, who serviced these units in the past, with no success. DRSI no longer support amateur equipment.

I would appreciate any information on this TNC, likely cause and fix, circuit diagram or repairer this side of USA.

I will refund costs etc. Thanks, Mick. G4RMN

I do have the schematics, but not in mailable format. And I don't know if
I am supposed to forward these, I got them from DRSI when I was writing the
driver for this card.

The type 2 has two TCM3105 modems. Port 0 uses U8 and associated
components. You say the RX LED lights, I presume you mean D6, the DCD 0
LED.
Check if demodulated data appears at TP2. This should also appear at pin
13 of U13. Also check if the same signal als the LED (DCD) appears on pin
19 of U13.

When U8 and U12 are socketed, try swapping them.

2755. Re: A couple of basic questions re PSK31

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-06-25 00:00:00 UTC
From: Rob <Pse@NoEmail.Com>
Message-ID: <F2z55.14777$qS3.38651@tor-nn1.netcom.ca>
Source record: 12050

Hi Martin,

PSK31 is a fun mode. Most of the software is FREE. But you will need to connect your sound card to your computer. If you are very lucky, you can connect your sound card DIRECTLY to your computer without any audio isolation transformers, attenuation etc.

But most HAMs have reported ground loop problems when the sound card is connected directly to the rig. It is a really good idea to use simple LOW cost audio isolation transformers on the two audio lines connected between your rig and computer's sound card. You may also have to use a resistor or two to attenuate the audio output from the sound card to prevent overdriving your rig (and causing undesirable distortion).

You can easily use VOX with PSK31. BUT if you decide to use your computer's serial port to key the PTT line of your rig, do NOT use the simple one diode, one resistor and one transistor circuit. It will create a DIRECT ground connection between your rig and computer's sound card DEFEATING the purpose of using the audio isolation transformers in the first place to break up the ground loops. Instead use a VERY simple circuit using a OPTO isolator or a relay.

For details on circuits (and the opto isolator circuit), see www.qsl.net/wm2u

You can also buy a ready made circuit called RIGBLASTER. But it is a little overpriced in my opinion.

There is LOTS of great PSK31 software to choose from. For a Windows 95/98 computer, DIGIPAN and LOGGER are very popular. (for Logger see www.itis.net/golist)

You may also want to TRY PSKHell. It is a great mode. In my view, it is more sensitive than PSK31 and copes much better than PSK31 with polar flutter.

All you need is a computer with a sound card (and the same sound card interface used for PSK31). The windows software is FREE and very easy to use. For details on PSKHell and all the other NEW designer Hell modes, see www.qsl.net/zl1bpu.

To obtain the great Hell software for Windows by IZ8BLY, see http://space.tin.it/computer/aporcino/

With your computer and a sound card, you can also try the latest new mode called MT63 (which uses 63 tones). The windows software by IZ8BLY is FREE. Again see http://space.tin.it/computer/aporcino/

G'Day to all...
Thanks for reading this message..!!

I'm trying to find out wether someone knows of the LinKT
Packet program has been ported to work under RedHat Linux.??
Unfortunately, as you probably knew, currently it works
using the SuSE Linux ONLY.

Any who is aware of this program, could you please let me
know..!!

Thanks in Advance..

Packet is dead here to. Killed by old fools running 1200 baud bbses and dreaming
about a 'live' keyboarding sessions.

I think we did it to ourselves on packet. I know the reason
I got away from packet, except for the DX cluster, is that the
coordinating body for it put all the BBS's on the same frequency.
It made it very difficult to use them because of all the collisions
on that frequency. It was just too much of a hassle to me so I
just stopped using it. I expect there have been a lot of other folks
who followed the same path or a similar path for other reasons. Of
course the rise of the internet didn't help because one could get
info much faster here than via packet.

Source record: 12051

One month old RCA LYRA Digital Music Player with 64 MB memory chip. With this, you can play 16-20 cd quality mp3 or real audio 2 tracks. It comes with Real Jukebox 2 for organizing files; a memory chip recorder and eraser, a tape for playing files in cars, and headphones. I LOVE this thing, but I need to get rid of things I don't really need in order to pay my debt. I purchased this at Best Buy a month ago and it is already too late to return. Normally, the 64 MB Version of this player is $249, while the 32 MB version is $189 (somewhere around there). It is in PERFECT condition and you are welcome to come see it if you live by Los Angeles. For more info, go to e-bay

Check out:

http://www.timewave.com

They bought out AEA, sold off the DSP-232's they had in stock due to design flaws but they also were able to come up with a new firmware chip, version 7.2, I believe which makes this machine usable for some things. They also have a resistor modification to increase sensitivity. Check out their website or even give them a call. They are pretty friendly & helpful. My DSP-232 works great for HF RTTY.

Good luck & 73's,
Ralph NH6QT/3

activity back.

Absolutely. Now that a lot of folks are getting super high-speed
connections in their homes via cable modems and DSL connections, there
is no reason why they can't put up a gateway, and let other people
access the Internet thru their station. An Internet-based packet
system would kick-ass. I can't understand why more people aren't doing
it - it is cheaper in the long run.

If die-hard hams start crying foul, because there is too-much
commercial activity, well then, we will just stay Part 15 compliant -
just mount those antennas high, keep your transmissions lines short,
and DO NOT use an inexpensive high-gain directional antenna :)

>Hello Brian,

No point in worrying about the "Y" cable. AEA produced that when the PC's were
so slow that they could not save FAX images and process data at the same time.
They also acted as RFI antennas, both into and out of the PK232. We recommend
that they NOT be used.

If someone wants WEFAX images, Have a look at HF WEFAX at
http://www.cssincorp.com

A "warbling" or "purring" sound, 14070 +/- a couple of kHz. The
sound lasts for some time, it doesn't come in brief bursts
the way packet does.

Check the web pages (others have posted pointers) for software,
other frequencies, sample audio, and so on.

The sound is like an unstabel carrier varing a few HZ. The transmissions usually last several minuters as the 'tone' is sent the whole time a station is typing out a transmission. Look for a program (free) called Digipan. You can set your receiver to 14.070 mhz and as you see the yellow bands appearing in the blue (normal colors, but may be differant) background , move your mouse pointer on the yellow and click on it. That is the audio offset frequency of the tone. If setup properly, you will also have set the correct tone of the transmitter. The tuning is critical and best to just put the receiver in the general area and tune with the mouse. YOu should be in the USB mode.

Source record: 12058

Actually for most PSK31 QSOs, it does NOT matter what sideband you use. The BPSK mode of PSK31 is sideband independent.

But the sideband is important if you operate the QPSK mode of PSK31 which is fairly rare due to the critical tuning involved. MOST Hams use USB for the QPSK mode of PSK31.

If you rig can only operate in LSB in the DATA mode, then make sure you select "use INVERTED QPSK" in the OPTIONS screen of the software. Then, if you ever make a QPSK QSO everyone else will be able to copy you and you will be able to copy them.

PSK31 is best described as a warble like sound

AEA PK900 Multimode Tnc Serial # 2352
Like new condition, All mode including Pactor, absolutely NO problems.
Has Latest 7.2 Firmware and DSP upgrade
Has AEA/Timewave internal 9600 baud modem, software selectable.
Has factory modem disconnect header, software selectable.
Perfect for satellite work.
NO mods or holes.
Serial cable included.
Selling for $350
You pay shipping.

Paccomm NB-96 9600 Baud modem.
Makes any 1200 baud afsk packet tnc with modem disconnect header into
9600 baud capable tnc. Front panel switchs modem in/out.
Sells for $119 new. Sell for $70 plus shipping.
Specs at www.paccomm.com

Paccomm PSK1 PSK Satellite modem
Makes any 1200 baud afsk packet tnc with modem disconnect header into
1200 Baud PSK modem for AO-16, LO-19 and IO-26 type satellites. Can
also be used for 1200 baud PSK terrestial work and receive 400 baud
telemetry format used by (late) ao-13 and upcoming P3D.
Sells for $239 new. Selling for $125 plus shipping.
Specs at www.paccomm.com

TAPR 9600 Baud modem
Makes any 1200 baud afsk packet tnc with modem disconnect header into
9600 baud capable tnc. Assembled, with docs on diskette. Formally
used in PK-232 tnc. Kit sells for $80 new. Selling for $25 plus
shipping. Specs at www.tapr.org

What have you done so far?

How is it failing?

Which mode?

What kind of sound card? Does it work as a sound card?

Kernel version, etc.?

My advise. Use a genuine Sound Blaster card -- not a clone. Also, for try putting input on the 'mic' input jack instead of the line input jack. I have a genuine SB Pro, and it works good for 1200 baud in Linux.

Listen to the output with proper speakers to make sure it sounds 'like packet' before hooking up to a radio.

Also, when you build the kernel, I find the easiest way for me is to strip out as much as I can in the kernel build process. I make it as small as possible, only including drivers I need. I turn off modules, and then 'make bzdisk' This makes a floppy disk, that I can boot up without having to screw up the system.

Hi all, I had an interesting field day.

Tried to run PSK31 at club site and due to major problems with QRM
that I feel were not any fault of PSK31. I packed up my station and
setup at home running 1E.

Got a late start because of the QRM problems above but still managed
86 PSK31 and 21 RTTY.

I was running MixW 1.42 software and must say this software rocks!
Don't let the somewhat spartan GUI fool you.

MixW has lots of contesting futures, requires minimal disk space. It
also supports other modes like RTTY.

I found it very interesting switching between running PSK31 and RTTY
- I only had to make one small change to the audio output setting on
my laptop to work RTTY after PSK31 and found the operators running
RTTY were going at a amazing pace. It was fun trying to keep up and I
think a lot of PSK31 operators could learn a trick or two watching
some experienced RTTY operators go at it.

I think PSK31 showed great potential, the fact that it can work with
minimal power and antennas makes it very well suited for portable use.
I used 100% emergency power for both radio and laptop (3 HD batteries
no charging during FD) and had hours left in each battery.

BTW I ran only 12 watts output on PSK31 and abt 25 on RTTY for all
contacts with a simple wire ant.

What's next? NTS???

I will have to try and write a proposal on NTS or NTS like messages
using PSK31.

That's all for now,

Dale KF4SIR

Line input works fine, but there's a bug (IMHO) in smmixer which won't
allow you to set the input gain level for the line input, and by default
it's set very low. I have a patch for smmixer here. Email me if you
need it.

Sent: Thursday, 29 June, 2000 08:24
To: sddxc@egroups.com
Cc: jqg@yahoo.com
Subject: [sddxc] SB 1714 California PRB-1, your support is needed

There is a bill now in Committee in the California Legislature SB 1714 which at first was an attempt to have PRB-1 limited federal preemption codified in the California Government Code. A well organized opposition has stripped the language which would have precluded a city of County zoning regulation form regulating ham radio antenna below 75 feet.

Those opposing the bill are well organized, It is critical to the eventual passage of a ham radio friendly statute for the voice of all amateur radio operators, and their supporters, such as those agencies and groups which benefit ad support amateur emergency communications to write, E-mail and call their Assemblyperson to support the passage of SB 1714.

There are at least two ways to find out who your assemblymember and what there address is:

1. Look in the government pages of your local telephone book. There you will find the local office of the assemblymember. Call the local office, and ask for the assemblymember's Sacramento office address.

2. Look at the web page http://www.assembly.ca.gov, and follow the "Find My District" link on the left side of the page. It will ask you for your street address, and return the name and contact information for your assemblymember.

Brad Wyatt, retired ARRL Pacific Division Director, wrote a letter to his assemblymember and the Local government Committee, which ARRL Volunteer Counsel K6HS has modified slightly to make "generic" and which is a good example of what you might say to your assemblymember. In writing your letter, put it in your own words to the extent possible. Otherwise, use parts of it or just copy it.

Be sure to send a copy of your letter to the:

Assembly Local Government Committee
1020 N Street, Room 157

Sacramento, CA 95814.

Here is the letter:

****

Dear Assemblymember <your member>

Senate bill SB-1714 has passed the State Senate, and is now before the Assembly Local Government Committee.

I support this bill and am asking you to support and co-sponsor the bill. Antennas and towers are key to successful communications for the 103,000 Amateur Radio operators in the State of California who are proficiency tested and licensed by the Federal Communications Commission.

As you may know, some cities, towns, and counties have developed land use standards which are so restrictive as to literally prohibit Amateur Radio communication. This bill would be consistent with and complement FCC Regulations, Part 97.15, in requiring municipalities to accommodate Amateur Radio.

The importance of Amateur Radio to California and the rest of the country is expressed well in the FCC rules:

§97.1 Basis and purpose.

The rules and regulations in this Part are designed to provide an amateur radio service having a fundamental purpose as expressed in the following principles:

(a) Recognition and enhancement of the value of the amateur service to the public as a voluntary noncommercial communication service, particularly with respect to providing emergency communications.

(b) Continuation and extension of the amateur's proven ability to contribute to the advancement of the radio art.

(c) Encouragement and improvement of the amateur service through rules which provide for advancing skills in both the communications and technical phases of the art.

(d) Expansion of the existing reservoir within the amateur radio service of trained operators, technicians, and electronics experts.

(e) Continuation and extension of the amateur's unique ability to enhance international goodwill.

These objectives cannot be achieved if Amateurs are precluded from pursuing their avocation at home by local actions which impose significant application fees and restrictions which do not, as the federal regulations require, reasonably accommodate the Amateur Radio service.

Please support the enactment of SB-1714.

Very truly yours,

<your name>

cc: Assembly Local Government Committee

****

Please copy and forward this email to everyone you can think of who is
or should be supportative to Ham radio ops.

I ran a digital all band station for the W2SE 11A effort in NNJ using
TrueTTY on PSK and RTTY. I had the same experience, the other station's
QRM (especially the 20M CW station!)at the site destroyed PSK. It has
NO tolerance for any background QRM! Traditional RTTY did much better
hearing through the noise. ended up with 65 Qs between the two modes,
most on RTTY on 20M.
When the QRM was down PSK worked great!
Ran 50 w into a ladder line fed 80M dipole @ 50 feet from a TS440 thru
a homebrew SPC tuner / 4:1 balun.
Will do it again next FD but will get as far away from the 20M CW
station as I can !!!

Graham:

CW is not low speed. And... CW is digital!

It is only low speed when sent at human sending and receiving speeds, say up to about 50 wpm.

And... even when processed by humans on the receiving end the signal processing techniques are of the most modern kind, utilizing both CSMA-CD, source coding and maximul likelihood (a.k.a Viterbi) decoding.

The so-called modern detection technologies such as Soft Viterbi Decoding, are simply mathematical, digital signal processing algorithms, which emulate, but not very well, what every good human decoder does.

Don't let anyone fool you...

Soft Viterbi Decoding -- a.k.a. using soft decisions, and the analog errors detected therefrom, to improve on a maximum liklihood detection algorithm.

Viterbi Decoding or Maximum Likelihood decoding or detection is nothing more or less than a "fancy" pseudo-mathematical name for an "exhaustive search" of the possible symbols sent given the noisy signal received! Just exactly what we humans do when processing CW reception.

Note that CW can also be decoded by a machine algorithm that implements Soft Viterbi Decoding, but because of implementation losses those machine algorithms have yet to match what a good human decoder can do at human speeds.

Then note carefully that CW can be sent and received at Gbps speeds by machines in the appropriate bands. And those transmission may readily be recorded and played back slowly for direct human translation if desired.

CW can be machine sent and received at much higher than human processing speeds even on the HF bands and as such it has many of the characteristics of the so called modern digital modes and certainly exceed some of them in communications efficiencey.

In fact many of the characteristics of CW transmission such as Huffman data compression [source coding] and CSMA-CD [Carrier Sense Multiple Access with Collision Detection], and maximum likelihood decoding [MLD a.k.a Viterbi Decoding] were first pioneered with CW.

Consider even today that, Peter Martinez' Varicode data compression (The Huffman-like source coding algorithm) invented by him for the new PSK-31 digital mode, although having a somewhat larger symbol set (alphabet), is not as efficient as the built in comma free variable length source coding of

CW!

Measure the coding efficency yourself of Varicode versus CW yourself if you don't believe me.

Were'e going backwards... Go figure?

CW is a digital mode, it can be high speed, it was the "first" mode as well, and it is both machine and human decodable.

Remarkable!

Think about it, it is in fact the only digital mode that is decodable both by human operators and machines!

Think about that! Try decoding Baudot RTTY by ear, or PacTor, or Clover...

Try high speed CW on HF with a keyboard program and high speed CW reader program, it often works as well as, or better than, at the same speeds, more modern digital modes on the HF channel.

Let's stop trashing CW and leave it where it belongs as the; longest standing, most cost efficient, most practically effective, human, and machine decodable high speed digital mode in existence!

In today's technology of the week era, what other robust industrial strength digital transmisson technology can match CW in its' price/performance characteristics, and its' pioneering use of most of today's so-called modern communications technologies?

I have just hooked up my rig to receive PSK-31. I downloaded a couple programs but after Steve (WB8IMY) Ford's review of Digipan in QST I went with that. I really don't have it all figured out yet and also have yet to get the wiring right for sending. I would like to hear your comments on which program you find best for which PSK-31 application. My uses will be strictly DX, ragchewing and logging.

Also, what seems to be the best method for keying, using the computer's serial port or the rig's vox?

You could have gotten that message there a lot faster with a "real" hi-
speed (>1Mbps) Internet connection.

> Im am now not active, but if I were to go on air again it would be
using CW.

Roadrunner, roadrunner, roadrunner goes BEEP-BEEP...

> Let us not flame each other but respect our differing interests.

I don't mind that you like to use Morse(I've even used it on
occasion). But please don't tell me not to flame the pro-code
requirements die-hards. Those backwards-thinking nincompoops
are "supporting Morse" for a TOTALLY different reason.

Supporting Morse Code and supporting Morse Code requirments are two
different things.

I say down with Morse Code licensing requirements, but up with Morse Code!

And I want to add to the licensing requirements a series of questions on:

Source Coding
Huffman
Arithmetic
Universal
Lempel-Ziv
Markov
etc...
Channel Coding
Lattice Coding
Trellis Coding
Turbo Coding
etc...
Signal Detection Algorithms
Maximum Likelihood Decoding
MAP Decoding
Sequential Decoding
Adaptive Equalization
etc...
Multiple Access Protocols
CSMA-CD
CDMA
etc. etc..

So that at the very least we will have a few folks on the bands and on this so-called digital NG who actually know what they are talking about and not mouthing some Bill Gates or Larry Ellison BS...

Get with it guys, Morse CW is digital, can be high speed, and it is efficient adn cost effective in the most modern terms.

The manual and mental processing of CW in real time by human beings should never again be the subject of tests and exams for an amateur license.

But... one should be tested on the communications theory and practice behind digital communications and in particular of one of the most efficient and practical means of digital communications, Morse Code!

Put more questions in the FCC exam question pools on digital communications, in particular force the examinees to explain why CW has such a high communications efficiencywhen compared to other less efficient digital modes.

So there I said it...

Nuff said...

2797. Re: Digipan Software for PSK-31

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-06-30 00:00:00 UTC
From: Bob Lewis <aa4pb@erols.com>
Message-ID: <8jj795$ib7$1@bob.news.rcn.net>
Source record: 12083

> would like to hear your comments on which program you
> find best for which PSK-31 application

I suppose you'll get many opinions on that - software is changing all the time. My personal preferences are DigiPan and WinPsk. Both have a very nice user interface. DigiPan has the advantage of displaying a "slice" of the band if you use wide receiver IF filters. You can then see all the signals in that "slice" displayed and click on any one to print it. The disadvantage of using a wide receiver filter is that your receiver AGC can be subjected to strong signals in the wide passband. Using a narrow filter in the receiver IF protects the receiver AGC from signals outside the narrow passband but now you have to tune in PSK signals with the receiver's tuning knob instead of clicking on them with the mouse. If I'm using narrow filters then I prefer WinPSK over DigiPan mainly because the smaller waterfall display seems better suited to the narrower IF.

> Also, what seems to be the best method for keying, using
> the computer's serial port or the rig's vox?

I'd highly recommend PTT via the serial port. Some rigs work fine with VOX and some overdrive the audio in order to get reliable VOX keying. An additional problem with VOX can be that you forget to turn it off and end up sending all those nice computer sounds over the air. With PTT the computer sounds don't get transmitted because the PSK software does not key the rig.

Message-ID: <395D3A54.BAEF08B6@att.net>
Source record: 12084

I use the Kachina radio which may influence how I approach the situation Bob described, but for what it is worth, here are my two cents.

My bottom line is that I *NEVER* touch the dial frequency of the Kachina while operating PSK31. I set the dial for 14.070 and use a 3.5 KHz filter setting. Thus, I can see from about 14.070 MHz to about 14.073500 MHz.

Now, when I see a weaker station that I want to copy and there is a strong station in the passband that is reducing gain through AGC action, I just punch up a narrow filter, usually 100 Hz - (two keystrokes), and use the IF Shift control to position the narrower passband directly over the weaker desired signal. If the IF Shift range is inadequate, then I grudgingly nudge the dial up 1000 Hz - but that occurs very seldom due to the wide shift range of the Kachina.

With the panoramic frequency display of DigiPan or WinPSK or Zakanaka (my current favorite) you can immediately see the effect of the translated passband and position it very accurately. There is no need to retune the radio or "touch that dial."

To return to "normal" operation requires only a keystroke or two to zero out the IF Shift and return to the 3.5 KHz filter.

The remarkable new paradigm of this class of PSK31 program has made it possible to perform almost all frequency operations in the software of the control program. It has made it possible to use radios with 100 Hz or even 1000 Hz tuning steps to be used very successfully on PSK31.

I sometimes chuckle that one of my motivations for getting the Kachina last year was to take advantage of its one-Hz tuning step capability and its remarkable frequency stability (seldom more than 2 Hz off of WWV). About the time I got the radio, DigiPan and the others came out and with them, the necessity for critical radio tuning went out the window. But, I still enjoy all the other neat features of the Kachina that no other radio, so far, has been able to offer.

Enough of Kachina drum beating! Sorry about that . . . but you really can operate PSK31 without hardly ever touching the radio dial.

I agree with Bob that PTT operation is preferable for many radios. I use VOX with the Kachina since it appears to work perfectly and does not introduce any compromises in signal quality. As Bob points out, though, you have to be careful to turn it off when not operating PSK31, or a lot of sounds may get out over the air. Again, the Kachina is a big help here: it allows 8 different complete station setups to be programmed and selected with F1-F8. I have 20-meter PSK31 set up on one key with VOX, and all the others for other bands and modes without VOX - saves me

having to remember! ;^)

CSMA yes, CD not really.

2801. how does PSK31 really work?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-07-01 00:00:00 UTC
From: "Charles T. Young" <ctyoung@mtu.edu>
Message-ID: <8jjjn7$6i4$1@campus3.mtu.edu>
Source record: 12086

I would like to know a couple of things:

How does PSK31 really work? Is it an ascii character set? How
is the modulation accomplished?

I have heard that DSP functions are present in a sound card.
Can someone tell me some more about that? Besides knowing how it
is used in PSK 31, I have another job for it. I want to do signal
averaging in the time domain. Another thing I would like to be able
to do is synchronous detection.

Anybody out there have any ideas on these questions? Could you please
send a reply to my email address? I look at that a lot more than
these newsgroups.

Thanks

Hamish:

Hello, how's the wx down under mate?

Well, Hamish, my friend, this is not an "old" line, and I have but just begun.

Here in America now with the most recent FCC rulings on test requirements, wer'e past the "kill CW reading ability on the test" problem.

Perhaps now we can all get back to other less emotional issues and really begin to get ham radio folks to , understand, and answer exam questions on digital communications.

Most of the "posters" on this NG, especially those digital "wannabes" who trash CW, simply know nothing about digital communications, and ... it shows...

Let's start educating them! And... I say let's use CW as a simple example that most could readily understand and anlayze in very modern communications and information theory terms, just as Morse and Vail did almost 150 years ago.

Simple but elegant examples and illustrations of modern source and channel coding technology are readily and easily analyzed in good old fashioned CW.

Thoughts, comments?

"> CSMA yes, CD not really.
>[snip]

Ever run a high speed CW net as net control station with about 20 - 30 participants checking in and handling traffic? Well I have... tune in to some of the (now slowly fading away) high speed CW NTS traffic nets here in the USA.

Heh, heh. Collision Detect (CD) indeed!

BTW... do you know who the inventor of CSMA-CD was? Hint, he lives in HI. Did you know that he was/is a ham?

[snip]
> I'd like to see you implement FEC in human-to-human CW!
[snip]

Hamish, you ignorant rascal, you talking about bandwidth IN-efficient implementations where the channel coding and modulation are separated -OR- about modern bandwidth efficient channel coding such as lattice, trellis, and turbo coded modulation?

Because if it's the latter a simple analysis will tell you that you are dead wrong, that's what every human CW operator does.

I can tell that you are not a very proficient CW operator or you would know...

How do you think high speed CW operators can copy way ahead of their paper copy [pencil or keyboard] in their heads?

It's called FEC...

Amazing how the human being/brain developed signal and information processing techniques "in situ" so to speak, and how modern era communications and information theoretic concepts and algorithms emulate what human code copiers do instinctively...

More???

I agree. I wouldn't include CW in that list though. It is simple
and moderately elegant, but it isn't as good a performer as the newer
modes. For one thing, on-off keying is less bandwidth efficient
than phase-shift keying, if I recall correctly.

I operate digital modes almost entirely. (Hellschreiber mostly;
admittedly, that's not digital but it's in the same group. Occasionally
PSK31, MT63, Throb etc. Also APRS on FM packet.) But I've never operated
CW. If I did, it would because it's different, not because it's
superior.

I use Digipan, shows a nice piece of the spectrum, a simple click on
the signal and there it is. Set the rig on 14.069.5 and leave it
there. You'll see anywhere from 3-7 or 8 signals at once usually.

Source record: 12095

The trade-off for CW is "technical simplicity" for "operator skill". The equipment doesn't require much in the the way of frequency stability or processing power. How well CW works depends mostly on how skilled the operator is rather than on equipment complexity. Minimum equipment requirements is the primary advantage to CW today (plus the fact that some enjoy using their CW skill just like some enjoy sailing).

The newer digital modes (pactor, PSK31, etc) don't require the operator to decode in his head, but the equipment technical requirements are much more involved. The result is bigger, heavier, and more power consumption to get the job done but the throughput is normally much higher than the vast majority of CW operators can handle.

If you want to compare the newer digital modes to computer decoded CW then CW looses hands down. On/Off keying is the least reliable way to transfer data between computers. Computer decoded CW gives you all the disadvantages of both systems.

Since CW has two states I suppose you can claim it's digital - but then so is the light switch on my wall. When you mention "digital" few will immediately think of my light switch or CW.

CW, like most modes, has its advantages and disadvantages. I don't get the competition between modes - use the mode that best suits what you want to do at the time or that you enjoy operating. The mode that does everything the best has yet to be invented.

My choice is WINpsk. The user interface is the best and while the receiving display is not as good as Digipan, it is still pretty good. The better user interface is worth sacrificing the display. My opinion.

Regards,

Duffy

we had the exact opposite expeirence. although there is way to much QRM from the Kilowatt amplifier on SSB to do other protocols such as SSTV or 300bps packet, PSK31 worked flawlessly, amazing everyone who stopped by. When we turned up the rigs speaker, often you could only here the noise from the other stations, and not even notice a signal was present! We used only 30 to 40 watts output, not causing any interference to other stations. It was amaizing, I must say.

Sound cards are basically a Digital-to-Analog Converter (DAC) to play
the sounds, and an Analog-to-Digital Converter (ADC) to record them.
Some sound cards have DSP functions in them, but for the applications
like you're talking about, the digitzed audio is processed by the CPU
under control of the software. For a really good tutorial on sound card
functionality, go to:

www.creative.com/developer

You can download the complete System Developer Kit (SDK), which includes
manuals, some software, and some samples.

Very good, I gave up completely on Digipan., However, there is also Zakanaka. You should try that. It does a LOT and can copy 3 signals at one time. It has some problems and some design things I don't like but I think it may be the best right now.

ALL the things can be found at HTTP://www.psk3a.com. ZAKA is best but they only put it up 24 hours at a time so you have to catch it. It just went up today for beta 8.

The free programs Winpsk and Zakanaka and EVEN Digipan are just as
good as Mix32, maybe better. TRUETTY is rather mediocre for PSK31, I
would use it only if you are using both RTTY and PSK31. It also is a
pay program.

Hamish:

My friend you are Dead Wrong!

Forward Error Correction (FEC).

There are two basic approaches to accomplishing FEC, and a myriad of subsets of algorithms within those two basic approaches...

As you suggest, both methods encode extra information into the transmissions to enable "correction" of errors at the receiver without ARQ.

For decades, the FEC "Gods" professed and believed that FEC could not be used without expanding the bandwidth of the transmission. For decades, FEC was said to be useless for the bandwidth limited channel. It was in fact only used on the power limited channel (Read long range space missions.).

Today there are two methods of FEC in wide use. In fact the newer, bandwidth efficient methods of FEC applied to bandwidth limited channels are now far more widely used than the power limited channel bandwidth expanding methods.

The oldest approach to FEC, is bandwidth in-efficient and expands the bandwidth of the transmission. The proponents of this bandwidth expanding approach believed that Shannon had said that coding and modulation had to be separated. (He said no such thing, but indicated that it was a good way to conceptualize communications systems.)

These bandwidth expanding methods were the only methods of FEC known up until about 1980 when Gordon Lang in Canada invented lattice coded modulation and in 1982 when Gottfreid Ungerboeck in Switzerland invented trellis coded modulation. The breakthrough made by these two great "inventors" was to combine coding and modulation in one integral operation/algorithm.

Hamish clearly as you, or someone else, pointed out up the thread "conventional" CW uses simple on off keying (OOK) of a single carrier as the conventional method of modulation.

And so... clearly CW operators cannot and have not done bandwidth efficient (integrated coding and modulation) FEC...

Now on the other hand for the much older and traditional approach to FEC, where coding and modulation are separate, many skilled CW operators and their communications administrators have in the past, and can easily add the first method of FEC to their transmissions.

In fact many commercial CW operators and certainly most military CW operators use FEC. This usage of FEC over CW began in WWII, "the big one" and has been in use continuously since then.

Of course you won't have heard it on the air in "plain language", but I can send you to several HF frequencies where you may copy on air CW FEC, generally in the format of "five letter code groups".

In fact, unlike for amateur radio examinations where the testing for CW prowress is done in plain language, for commercial and military sending and receiving CW tests, the tests invariably include/included code groups, many of which are/were FEC encoded.

Now it should be noted that if a modulation more complex than OOK is allowed, and it is, then CW systems could easily be devised to accomplish bandwidth efficient FEC as well.

So there!

FEC is not only possible over CW, but has in fact quite been commonly been used.

As I stated further up the thread, mosr of you so-called "digital" communications "experts" who post on this NG, know not whereof you speak when it comes to digital communications and CW!

Hamish, no personal offense meant, but you were just plain WRONG!

Comments, thoughts.

Best Regards,

Peter K1PO

Interesting comments Peter. Obviously FEC is possible with any
modulation system, as in your five letter code groups example.

However, I was really referring to casual QSOs between amateur
operators using normal decoding methods ie their ears, brain and
perhaps a bit of paper, for real-time decoding. Which is how
CW is usually done by amateur operators.

I don't pretend to be an expert on this subject by any means
Peter. I just enjoy operating some digital modes (CW not being
one of them).

Hamish

Hamish:

You love digital communications, and so... "I love you man"...

Just don't "trash" CW...

Hamish... CW is digital, it is efficient, it incorporates many of the aspects of so-called modern digital communications, and it has led the way for 150 years...

I certainly respect your desire, and today your right, not to have to develop the skills to copy CW manually at high speeds.

But now that issue is finally "settled" and behind us, let us give CW the space and respect that it deserves.

BTW... Hamish... here's a question for you.

It so happens that, due to living so many years on this earth, I have come to learn to copy and send high speed CW (`~40 wpm) and... I have also learned to touch type on a QWERTY keboard with low error rates at up to 70 wpm. I learned these "skills" through dint of hard effort and many many hours of practice, because I hated them both with a passion and I was forced to learn them by my employers. Heck all I wanted to do on ham radio was learn to operate the PTT button on a phone rig!

However, today I am a competent high speed digital "keyboard operator" as well as a high speed CW operator and not just a file transfer "wannabe"!

so...

As a keyboard QSO'er yourself, and not necessarily a CW affecionado, which do you think is the harder skill to develop, in terms of [As aircraft pilots are fond of saying.] the "stick time" required?

Touch typing at 50 words per minute -or- sending and receiving CW at 35 words per minute?

Both are difficult and time consuming skills to master, there are no easy ways to acquire either, but the stick time comparison would surprise you...

Someday if you wish, I'll share with you my personal "stick times" to reach those milestones.

Hamish the "kill CW" wars are over, I say just drop it now!

Time to stop trashing CW... and time to start developing robust digital modes for HF use, as Peter Martinez and others are currently at work doing.

But... to make the progress we should, we need, not just digital operators [who are always welcome] but also digital communications technologists who have a deep understanding of the principles of digital communications, who can apply that knowledge to developing new and better modes. A good way to encourage this is to add more such material to the sylabus and requirements for the amateur radio examinations.

I say, if we take CW skill testing out of the amateur examinations, that we replace it with an in depth theoretical and practical test of knowledge in the digital communications arts, beginning with the theoretical background for CW's effectiveness and leading upwards from there...

I feel that today the lack of such theoretical and practical digital communications material in the amateur radio examinations is a travesty.

Thoughts, comments?

Source record: 12010

The FAA is the better model for testing. Not only do you use a
computer to test, and get an instant grade; indeed, you need to
take a practical test with a certified person.

These steps are also much more costly.

Here's my proposal then. Each Ham must pass a Class 3 Flight Physical,
and not be handicapped in any way. Hams must not be allowed to
use strollers, crutches, or wheel-chairs of any kind. They must not have
high blood pressure, and have a 10 year history of no tobacco, alcohol,
or other contraband drugs as listed by the Surgeon General.

Each Ham will be required to have a mentor for 20 hours, and solo for
another 20. During this solo, the candidate must build a transmitter and
receiver from scratch, and learn to operate CW at a minimum of 20 WPM.

A Ham ticket will last for 36 months for individuals 30 years old or less,
and 24 months for those older than 30. Each renewal will require a
written and practical test. The practical may result in write-ups that
require retraining, and the Ham cannot operate until retested. If the Ham
fails to retest in 15 days, the license is revoked.

All Hams must wear a tie and long sleeve white shirts when operating.
Women can't wear pants, and their hair must not be in curlers. Clothing
designed for underwear cannot be worn outside other clothes. Hams
cannot operate while in the nude or wearing underwear.

There, that should create a whole new bunch of Hams to fill the spectrum,
which will be completely unlike anything being done now.

Steve
P.S. You're still in the wrong newsgroup.

Steve:

Hey I did not start these CW-Digital threads, I am just a passer by... don't blame me.

BTW... What about drug and alcohol testing?

Heh, heh...

OK, OK, Steve I give up.

Let's just give out ham licenses to everyone who asks -or- eliminate the license altogether for digital operators!

Let's define a digital operators radio license and force the digital operators to operate from a keyboard attached to a computer running a MS application on Windows which controls their transceiver and kilowatt amplifier and protects them from causing harm to themselves and others...

They can measure bandwidth in characters per second, energy in information theoretic terms such as nats, and stuff like that... and not bother with those pesky Hz, Joules and stuff!

After all... there is no longer much of a chance for risking human life by the use of radio transmitters.

Steve, did you ever hear about or look at the digital radio operator's certificate that the Canadians implemented back in the 1970's?

What ever happened to that license?

Steve what do you propose for licensing for digital operators?

Very well. :-)

>Is it an ascii character set?

No, it uses Varicode, which is a variable length
character encoding which offers some compression
on plain text. This allows use of 31 baud to convey
about 55 WPM.

>How
>is the modulation accomplished?

At audio. It is a binary phase shift keying (BPSK) method,
done at baseband and fed to a SSB capable radio.

(There's also a QPSK variant done basically the same way,
but because the phase shifts are 90 degrees instead of 180
degrees, it matters whether your radio operates USB or LSB.
You have to match the sense the other station is using. For
ordinary BPSK it doesn't matter which sideband you use.)

>I have heard that DSP functions are present in a sound card.
>Can someone tell me some more about that? Besides knowing how it
>is used in PSK 31, I have another job for it. I want to do signal
>averaging in the time domain. Another thing I would like to be able
>to do is synchronous detection.

Some sound cards have limited DSP functions built in, but most
programs do not use them (because the brand of sound card would
then matter). The sound card is used only as an analog to digital
converter and digital to analog converter (typically by calls to the
Windows sound API, or the corresponding Linux sound API). All
signal processing is done by the main CPU of the computer,
hence the usual requirement of a Pentium (or better) class
computer to handle the processing. Since those are the norm
today, that's no handicap.

There are basically two ways to do I/Q demodulation. The direct
method feeds I to one channel (say the left channel) and Q to the
other (with I and Q being generated by an external LO and quadrature
mixers, ie as in the R2 receiver). I haven't had much success with
this method on a PC, though it works fine with dedicated DSP

hardware. I think it is because of the interrupt timing, and OS dependencies, the PC has, but it could be just my ineptness at programming this sort of thing.

The second method digitizes the composite signal as if it were just a low IF conversion, then uses numerically simulated oscillators and delays to do the entire demodulation process in software. This is more complex, both on the radio side and the software side, and has some practical drawbacks, but it works on the PC under the usual operating systems.

Once you have I and Q, synchronous detection is a piece of cake.

>CW is a digital mode, it can be high speed, it was the "first" mode as well,
>and it is both machine and human decodable.

While the OOK modulation typically used is in a sense digital, ie an AM encoding
of on and off states of the baseband signal, Morse Code is not digital. It is a timing
code, all the coding information is in the timing edges, not in distinct levels. While
ideally that timing is derived from a fixed clock, in practice it generally is not and
must be considered more of an analog process.

>Remarkable!
>
>Think about it, it is in fact the only digital mode that is decodable both
>by human operators and machines!
>
>Think about that! Try decoding Baudot RTTY by ear, or PacTor, or Clover...

Actually, some people can decode Baudot RTTY by ear. Of course the
fact that it is normally sent at 60 WPM or faster makes that a bit difficult,
but slow it down to normal CW operating speeds and it is not difficult
to decode by ear. In fact FSK is somewhat better (6 dB) than OOK
because the ear is deciding between two distinct signal states and not
between the presence and absense of a single signal against noise,
which is a harder detection problem.

In the old days, when using arc and alternator transmitters where it was
technically difficult to generate OOK, operators used FSK to send Morse.
It worked better than OOK then, and still does.

>Try high speed CW on HF with a keyboard program and high speed CW reader
>program, it often works as well as, or better than, at the same speeds, more
>modern digital modes on the HF channel.

But it almost always occupies a larger bandwidth. The sharp timing edges
essential of Morse coding causes the occupied bandwidth to be larger than
modulation techniques using continuous phase modulations.

You're dreaming! I've worked machine CW at 80 to 90 WPM on HF and it
worked pretty well *with an excellent signal to noise ratio*. It falls
apart pretty quickly when the SNR drops - long before any of the
modern digital modes including plain old RTTY.

2829. TM-D700A and Tripmate?

Message-ID: <8jo8jf$f0s$1@news.imagin.net>
Source record: 12015

Is anyone using the Trimpmate as a GPS with the Kenwood TM-D700A?

I tried today without any success. I terminated the Kenwood GPS cable with a DB-9 male connector with Pins 2&3 jumpered to loop the ASTRA signal back, then connected the red wire to pins 2-3 and the shield to pin 5. Set the D700 to NMEA GPS mode. No joy. didn't get any POS input on the display, and no Auto APRS output.

Need some help, or a reason I have to go get a GPS III+.

Thanks,
Randy - K5MW

Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any amateur topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and its
content drifts further and further away from being "on-topic" in the
various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman, KH6O

Gary:

Heh, heh...

Gary, this is unlike you! Usually you are right on point.

But here you are WRONG.

There are some aspects of analog in hand sent CW, this would be interperted only as a timing "jitter" effect which all digital communications systems from SONET lightwave systems to ELF submarine data systems, have to various extents.

In fact even this aspect of CW has been addressed by coherent CW enthusiasts who have addressed the timing and synchronous detection problems you alluded to.

Also... from a channel coding and modulation viewpoint, CW can easily be transmitted using a variety of modulations from FSK to PSK, to whatever. It just then makes direct copy of the sound "by ear" less familiar to operators, a conversion device to convert back to a keyed tone would suffice for human readability.

Often when I run CW from the keyboard with computer decoding at speeds up to 100 wpm and greater no human could ever copy it anyway.

Gary despite what you say, CW is truly digital!

By anybody's definition, what else would it be?

Always was digital, always will be digital.

It is so advanced in it's design concepts that it is not even a simple binary system, in fact it is a multi-level digital logic code.

It uses a ternerary code alphabet with three symbols, space, dot, and dash these three symbols could be assigned the labels, A, B, and C and sent by many modulation methods. Up to and including modern trellis coded, lattice coded or turbo coded modulations. What???

Even as CW is conventionally encoded and transmitted this ternary channel code incorporates a highly efficient source coding algorithm which is variable length and comma free. And this was all invented over 150 years ago, long before Dr. Shannon was even born and the concepts of source coding and channel coding were elucidated in the modern sense. In this respect CW is similar to but more efficient than the Varicode that Peter Martinez designed for PSK-31...

What???

Gary, if you cannot make intelligent contributions to this thread, I suggest that you go back to the "rec.radio.amateur.antennas" NG, you know more about antennas than you do digital communications!

And besides, my friend, heh, heh you'r spoiling my fun here on this thread...

While the OOK modulation typically used is in a sense digital, ie an AM modulation of on and off states of the baseband signal, Morse Code is not digital. It is a timing code. All the coding information is in the timing edges, not in distinct levels. While ideally that timing is derived from a fixed clock, in practice it generally is not and must be considered more of an analog process.

>Remarkable!
>
>Think about it, it is in fact the only digital mode that is decodable both

Actually, some people can decode Baudot RTTY by ear (I can pick out my own call sign and the RYRYRY signal for example). Each character does have a distinctive sound if you train your ear to recognize it. Of course the fact that it is normally sent at 60 WPM or faster makes that a bit difficult, but slow it down to normal CW operating speeds and it is not difficult to decode by ear.

In fact FSK is somewhat better (6 dB) than OOK because the ear is deciding between two distinct signal states and not between the presence and absence of a single signal against noise, which is a harder detection problem. In the old days, when using arc and alternator transmitters, where it was technically difficult to generate OOK, operators used FSK to send Morse. It worked better than OOK then, and still does. Too bad most Morse operators got away from that type of moduation. Both machines and men could take better advantage of it than OOK.

>Try high speed CW on HF with a keyboard program and high speed CW reader
>program, it often works as well as, or better than, at the same speeds, more
>modern digital modes on the HF channel.

But it almost always occupies a larger bandwidth. The sharp timing edges essential to Morse coding cause the occupied bandwidth to be larger than modulation techniques using continuous phase modulations. Most machine methods sample in the middle of a bit time to determine the value encoded, so the symbols can be rounded to raised cosine shape without harming the ability to decode the signal. But you can't do that with OOK Morse because the information is encoded in those sharp timing edges, not in the signal levels.

Symbol durations and spacings aren't uniform with OOK Morse either, so finding a symbol center would be problematic even if it were useful to sample there to decode the information being sent. Designing a matched filter for OOK Morse transmissions of a priori unknown text is also impossible, but is a commonplace technique for uniform codes. It is a proven fact of communications theory that a matched filter is the best you can do, and you can't do that with OOK Morse.

The use of uniform codes and phase continuous modulations allows far superior performance to the use of Morse and OOK. The only claim to fame of the latter is the simplicity of the equipment involved, but that's traded against the greater operator conditioning required. That's often the largest variable in the communications equation, ie the weakest link of the system.

It is remarkable that it works at all, much less as well as it does. With machine methods, that large variability is removed. The machine works just as well regardless of the operator using it, and machine methods can take advantage of better modulation forms and codes that humans have difficulty using manually. (Some say that takes the fun out of operating, I disagree, but say it is their choice if they wish to handicap themselves in that fashion.)

Is OOK Morse a digital mode? I don't think so. While it shares some elements with digital modes, it is also different from them in important ways. I think we have to classify it as an analog PWM baseband coding using 2T AM modulation of the main carrier. It is a bandwidth and power hog compared to some more modern methods (so is analog voice, of course, and that doesn't stop us from using it if we choose).

It is a testiment to the remarkable pattern recognition ability of the human brain that OOK Morse works at all. That's why machine decoding of OOK Morse hasn't fared so well. We don't yet have machines with the particular sort of pattern recognition abilities of the human mind. However, if we strictly define the patterns we intend to use in accordance with sound communications theory, as we do with the better digital methods, then machine methods can far outstrip the human brain as modem.

That's not because machines are smarter. It is because they can use codes and modulations superior to OOK Morse while the human brain has difficulty handling the patterns produced by those codes and modulations manually. Our mental pattern recognizers, flexible though they are, aren't optimized for the sorts of signals which perform best in noisy or interference laden channels.

Well, since "CW" in the amateur radio context specifically means "Morse telegraphy
via bandwidth-limited on-off keyed AM", you can't easily transmit "CW" using a
variety of modulation techniques.

Once you start talking about PSK, for example, you're talking about something
totally different in terms of performance.

As for the rest of your Morse advocacy arguments, to each his own.

Gary:

You are waffling again...

Good human operators making use of their pscycho-acoustic abilities and with appropriate filters and processing in front of them while copying CW can usually always beat your vaunted "modern" digital modes over a congested and noisy HF channel. [The comparison has to be calibrated at the same data rates, of course humans can't operate at thousands of bits per second, but that's not the point. The point is that humans can beat the modern digital systems using CW at the same information rates! Period!]

The fact that no one has yet implemented a machine decoder that can do as well, is simply a statement of the vast improvements still available in digital signal processing.

Human beings are likely actually instinctively implementing a pure full non-linear Bayseian receiver process and such a non-linear Bayseian receiver has never yet been economically implemented to run in real time at the speed and a price amateurs can afford.

I agree that most CW is conducted using simple OOK, but so what. To be fair in a comparison then all other modes should use the same modulation. If they can use more advanced modulation, then there is no reason why CW cannot do so as well.

And so... if CW was sent and received by human operators over an "advanced" modulation system, say generalized QAM, or DMT/QAM or whatever, then that would be a fair comparison.

Even so, without that, CW the superior digital mode, when decoded in real time by skilled humans invariably beats the new complex modulation schemes in the new modes running on everyday HF channels.

Want to run some tests at the same data rates, the same bandwidths in some typical HF channel conditions while varying the "interference"? I've done it often... When the other modes have long faded... the CW guys are still communicating. What, why?

The question is not about the fact that it is a superior mode, that is an established fact!

The real interesting question is why?

Why should the trained human using an apparently simple external digital system be able to out communicate modern digital systems over real HF channels? What is going on inside the operator's head, ears, and hands? What???

If you could answer that you would have a lead on how to efficiently implement economical and robust machine based detection algorithms.

Sort of like the speech recognition problem, they still can't beat the human ear and brain!!

Gary what is going on with this why does everyone trash CW instead of investigate its' superiority?

Why? Are you not interested? Is it not an interesting digital communications problem, challenge, etc....

What?

Why do you waste your time denying that the skilled human operating at comparable data rates is still superior to the best digital modes in use today? Why not find out why and then try to improve the machine based modes?

Stop trashing CW and learn something!

Best Regards,

Peter K1PO

Binary systems usually attach some kind of weight (e.g. 1, 2, 4, 8 ..)
to each binary digit. The sequence above is a combination of pulse
width and pulse position modulation (that would be V1A designation
instead of A1A :-), producing 5 different symbols, that are used to
code the character set. So conceptually, this is quite similar to the
EFM (eight-to-fourteen modulation) used in CDs, which produces 267
usable symbols from a 14 time slot sequence.

I don't have any particular grudges there. I have a full unrestricted
license here in Australia, for which I took two exams: one of receiving
5 minutes of solid copy, and one of transmitting 2.5 minutes worth,
both at 10 WPM.

I confess that if I didn't have to learn it, I probably wouldn't have.
I do find it useful on occasion though (repeater/beacon identifications
if nothing else). I may try it on the air one day.

Both come readily with steady practise I'm sure. I've done that
practice at the keyboard for sure.

I agree. Having said that, I wonder if it's too much to ask
on the license exam.. the theory is not exactly trivial I'm sure
you'll agree.

So Peter, when you say "CW" do you mean Morse code or OOK? One is
an alphabet (like Varicode is) and one is a modulation (like BPSK
and FSK are). Or do you mean the combination?

I don't see any advantage in OOK. The alphabet is fine, but
really independent of the modulation as far as I can see. It's just
Huffman enccoded and not something to get too excited about
I would've thought.

> Always was digital, always will be digital.

You can use a computer to sample it and decode it, but that doesn't
make it digital. You can use a computer to recognise speech and
music these days too.

Cecil:

Thanks for the example of the binary rendering of CW, very illuminating.

BTW... I am sure that you are aware that the manual use of CW encompases multiple encoding stages. This simple fact seems to be lost on many who post to this NG!

CW often begins with written plain language [Although when used with encryption or FEC in-line at the source it is not necessarily plain language, the ubiquitous five letter code groups of the military, commercial, and intelligence communications communities will prove that.] which consists of symbols drawn from a 26 + symbol "alphabet".

Then in the generation of CW the data stream is next encoded into a three level or terneray code [dot, dash, space -or- alternatively A, B, C].

At the output of the basic 26+ level to three level coding operation, a further bandwidth expanding FEC encoding is performed just before the symbol stream is applied to the modulator [a.k.a. "key"].

This FEC encoding operation converts the data from a three symbol alphabet to a two symbol or binary alphabet, in that last encoding process. As aptly illustrated by your posting, The human receiving operator makes use of this bandwidth expanding final encoding from ternerary to binary and makes use of the additional added information to "correct" potential errors as he or she copies the code in real time. [Contemporary coding theorists would call this Forward Error Correcting or FEC coding.]

Very elegant and very efficient... but relatively un-appreciated by the un-initiated!

Cecil, as I said up the thread a little ways, most of the "so-called" digital experts who hang on this NG are completely without background or expertise in digital communications, they cannot even analyze a digital communications scheme as simple as CW!

What???

Hamish:

Hamish, one of the things that really annoys me in the incorrect comparisons the very fuzzy thinking applied to digital mode comparisons!

There are "digital modes", i.e. AMTOR, CW, Clover, RTTY, etc... but each mode often consists of several stages of source and channel encoding, modulations, and the subsequent de-modulations and decoding.

Often the mode comparators, opportunistically take the "modes" apart in their comparisons and compare a whole "mode" to a modulation. Say in this case comparing OOK to PacTor. OOK is just a modulation, while PacTor is a whole mode repleted with several stages of encoding, embedded modualtion and channel coding, etc...

Let's always be professional, and make apples to apples comparisons and be scientific in our comparisons shall we?.

Hamis, about Gary I am sorry, but Gary and I are old friends from another amateur NG... I didn't mean to be rude.

But I do get emotional when folks trash CW without thinking.

Gary I love you and, I appologize, here's a :-) for ya!

That's the binary number system that does that. Assignment of bits
for each unique ASCII character could have followed any unweighted
pattern and position in time need not correspond to any mathematically
weighted value. Morse code and ASCII are simply two different ways of
coding the English alphabet. When Morse code was defined with respect
to one fixed-length 'dot' time, it resulted in a one-to-one correspondence
to a binary bit stream. A lot of CW repeaters IDers are encoded into
BINARY EPROM memories.

Exactly!

But then I suppose the un-initiated will toss in some more exotic and arcane modulations to confuse the arguments.

My point is that CW is a digital mode, and danged efficient at that!

Why is it that so-many refuse to accept those facts?

CW has become far to much of an "emotional" issue for many, they have lost their sense of perspective.

Many of these "digital" guys and gals are quite intelligent but have no perspective.

What was it that Marvin Minsky, the great digital age guru. said once about artificial intellig,

"An ounce of perspective is worth 50 points of IQ!"

Regards,

Peter

Yep, for those of us who already know Morse code, CW is quite often
the best ROI. I had fun learning Morse code in the Scouts and never
considered it a chore. Even after the code requirement is eliminated
I will continue to encourage all hams to learn Morse code and try CW.

I'm having essentially the same argument on an unrelated newsgroup.
"Other modes are better than CW" and "Casino Blackjack cannot be beaten."
My answer to both is the same. "Who cares, I'm having fun." 73, Cec

Hello everyone,

I recently purchased "Radioraft" digital decoding software (for use with a receiver/transceiver and a PC demodulator), here:

http://perso.wanadoo.fr/radioraft/

After purchasing the program and trying to give the author some positive suggestions about how he could improve his program (specifically, the way the copy protection technique he uses causes problems, and that it might be helpful to add fax capabilities), I got a very cynical and nasty answer from Franï¿½ois Guillet (the author of the program) telling me that "since I was a programmer maybe I should write the software myself, since I seem to know better than he does how to write and manage shareware." He repeated this in two Emails, using different wording.

This person does not know how to deal with a customer or how to provide customer support, and he is not open to suggestions as to how to improve his program, even from registered users. I would recommend you stay away from this software and purchase something else, from someone who is more pleasant to deal with, and is open to suggestions for improvements. This is the first shareware author I have ever run into who does not actively invite suggestions for improvements to his software, but instead is nasty, cynical and hard to deal with. Don't waste your hard earned money on his DOS-based software, look around for something else that will do what you need it to do, written by someone who is more flexible and willing to talk to someone who has just spent their money on his software and at least listen to constructive suggestions.

Just a thought,

Tim

Gary:

You are getting reckless with the truth now...

I'll go through the post below by "snippets" for you...

[snip]>
> CCW technique, which is different from CW, does use fixed clock timing,
though
> it doesn't use uniform symbol timing (it can't, because the symbols aren't
uniform).
> The information is still encoded in the symbol edges, which are harder to
detect than
> the mere presence or absence of signal.
>[snip]

The symbol edges ARE uniform. There are only three Morse Code Symbols, the dot, the dash and the space. When transmitted in time, they are usually synchronous with a "dot" clock. i.e. the basic Unit Interval of Morse is the length of the dot, the dash is three dot's in length and the space is one dot in length. Morse is a comma free code, synchronous in time with all the "edges" lined up exactly on the "dot" clock, the only ambiguity in timing would be considered a "jitter" due to inacurate clocking resulting from human hands. The timing "jitter" or the timing itself encodes no information.

I repeat again for clarity, Morse is a three level code, it consists of just three symbols, the dot, the space and the dash, call them A, B & C or X, Y & Z, no matter what you call them there are still only three.

Gary, count em, ddot, space, dash, 1, 2, 3... one can construct any Morse message from just those three symbols alone an none other. So there...

Inter-character and word spacing are symbols, as we know, in the rendering of plain language texts such as written English, these symbols are not present in Morse, rather they are encoded into Morse using the three Morse symbols. for instance, the Inter-character space [white space symbol] is encoded in Morse by a Morse space symbol, the inter-word space symbol [another white space symbol] is encoded by thee Morse space symbols. And the "new line symbol [carriage return line feed symbol concatenation] are encoded by the Morse sequence [AA or didah didah] dot-space-dash-space-space-space-dot-space-dash]

[snip]

you
> talk about the character encoding, the baseband modulation, or the
> transmission modulation so that we can know what you mean.
[snip]

Gary lets not get pedantic, CW is an acronym and it actually stands for
Continuous Wave. As you well know, Morse is definitely not a continuous
wave, in fact a "real" continuous wave is a mathematical fiction, not
possible in nature.

So ... Gary it is not me, but the folks who trash CW by making silly apples
to oranges comparisons between Morse [CW] and the other digital modes who
are imprecise!

[snip]
> No, I disagree. CW encompasses all of the items I listed above.
> That is not a digital system. Taken individually, some of the elements
> of CW might be considered digital, but taken as a whole CW is not
> a digital transmission mode.
>[snip]

Gary you are entitled to disagree, that's your "right" but that does not
make you right!

[snip]
> Actually, Morse is a quintenary code. It has five symbols, the dot, the
dash,
> the intracharacter space, the intercharacter space, and the word space.
> When conveyed using OOK AM (aka CW), the latter 3 symbols aren't voiced,

[snip]

Wrong! Gary, Morse is ternary, see my comments and example encodings above

[snip]
> Varicode is one of the shortcomings of PSK31. It limits the ability to do

> operators can't even detect the presence of a signal at all.)
>[snip]

Not true, Shannon showed in both his landmark 1948 Proc. IRE paper and his
subsequent 1958 paper the rationale for source coding and channel coding and

their respective roles in communications efficiency, I'll pass the
references to you for your perusal, such a subject cannot be easily expouned
in the limited time available to those of us who kibbitz on Usenet NG's.

[snip]
> You are incorrect. I've devoted much more study to digital communications
> than I have to antennas.
>
> >And besides, my friend, heh, heh you'r spoiling my fun here on this
> >thread...
>
> That's what I do best.
[snip]

Gary my friend there is no doubt that you are "well informed".

But your knowledge of this area apparently includes some "holes" and a
little bit of fuzzy thinking.

"A little knowledge is a dangerous thing, but drinking deeply of that...."

Lord Byron

And so... Gary I ask you not to trash CW until you learn a little more
about digital communications.

Best Regards,

Peter ["CW is digital"] K1PO

> signals up to a positive Eb/No.
[snip]

Gary, tsk, tsk.. *inaudible* PSK-31, heh, heh. Don't give me that stuff.... it's anececdotal hearsay based upon non-scientific observations. Most folks "listen" to PSK-31 in a 2.4 kHz bandwidth, in fact you hear them bragging of seeing several simultaneous signals in their digipan display, but hearing nothing, heh,heh.

The reason they don't hear is because they are listening in a 2.4 kHz bandwidth which lets in too much noise and interference which drowns out the PSK signals, but the PSK-31 decoder is listening in a 100 Hz bandwidth through it's digital filter [Matched filter, nearly.].

If the human listened in the same bandwidth it would be perfectly audible. Jeesh, give me a break!

100 Hz bandwidth signals on the HF channel are very often inaudible in a 2.4 kHz bandwidth but perfectly audible in a much narrower bandwidth, [the matched filter]!

Gary, unless you have done this, don't talk about it...

Simply copying a narrow band digital mode when you can't hear it in a wider band means nothing, nothing nothing!

Gary.... Time and again CW operators have demonstrated their ability to copy CW signals that are inaudible to the ear [Of a person listening in a 2.4 khz bandwidth]. In fact I myself have personally done that many times.

I have often gone off frequency [QNY] on a CW traffic net in bad conditions of QRM, QRN, etc... and passed 10 messages in 15 minutes with perfect copy,

under conditions when the average ham couldn't hear either of us. Because me and the sending operator, zero beat each other and cranked in our 75 Hz BW filters and hunkered down. Meanwhile a ham down the street who was supposedly monitoring the frequency to pass more traffic to me [QRV], heard nothing on our frequency and went back and so reported to the NCS... he simply didn't know the exact frequency we were on and couldn't find us with only his 2.4 kHz filter in line, he needed to cut his bandwidth way back to 100 Hz bandwidth to get us perfect copy! In this case the 75 or 100 Hz was/is close to the matched filter for CW at 18wpm...

Gary human operators running CW with "matched filters" can perform just as well as PSK-31! No doubt about that. The only problem is for most hams is that they don't have sufficient CW skills to do it themselves. That's just a fact of skill training not an indictment of CW as a digital mode. I maintain that CW is just as efficient as PSK-31 when received by machine in the same bandwidths and superior when recevied by a skilled human operator.

Now if we can only learn what the human operator does instinctively while copying under those conditions maybe we could find more economical and robust machine algorithm decoders for digital modes!

What say you? Is it not worth study? What does a skilled human CW operator do that is superior to the receiver implementations of PSK-31?

Now I am not putting down PSK-31, it is indeed a fine mode. In fact because it approaches, but does not match human operators using CW, it gives many the opportunity to experience the thrill and effectiveness of operating a highly efficient digital mode on the HF channel without having to learn the skills of copying Morse effectively by ear.

[snip]
>
> Matched filter technique cannot be applied to CW because the waveform
> has no a priori known spectrum when unknown text is sent. (If you know the
> message that is to be sent, you can form a matched filter for the
transmission,
[snip]

Gary, in practice, as you know there is not real "matched" filter, since the "matched" filter would be anti-causal. All so-called matched filters are merely approximations to an ideal matched filter. Gary not very many are even good approximations. In fact in most modern "digital" receivers the so-called matched filter is just a duplicate of the transmitter filter! Not matched in the ideal sense but "close". For instance the "easy" way that most digital designers use is to put a so-called "raised cosine" filter in the transmitter, with alpha around 0.1 - 0.12 or so... and then they put the same damm filter in the receiver! That's not "matched" and you know it! I know it because I have designed many of them....

When it comes to "matched filters" Gary, "close" is what is wanted, and "close" is all that's needed.

Gary a the 500 Hz, 250 Hz and 100 Hz CW filters on my HF receivers are very very close to an ideal matched filter for CW at hand sending speeds of 18 - 25 wpm. In fact they are a much closer approximation to a "matched" filter than many of the so-called matched filters in the modern digital mode decoders! Lie the "raised cosine" approximations I mentioned above.

BTW... have you ever used the narrow CW filters on your HF receiver, if so how often? etc... etc... They are pretty damm good approximations to matched filters.

[snip]
erformance. CW just isn't as good as some of the more modern
> techniques.
>[snip]

Yes it is...

[snip]
> we may
> continue to use CW if we like. But it is a mistake to try to claim for
> it a superiority that it does not enjoy in fact.
[snip]

Wrong! Gary CW when run at comparable data rates in the same bandwidths with appropriate filters and highly skilled operators is almost as efficient as most of the so-called new digital modes...

And what is more, we stand to learn something from observing human operators and studying how they can beat some of the best modern decoding algorithms. Perhaps we could learn to implement similar algorithms to those found in the brains of the best human digital operators.

Gary,

You might as well give up. No amount of logic is ever going to convince him that CW isn't the most reliable, most efficient mode ever to be developed. The developers of network systems made a huge mistake in not using CW for all computer networking applications :-)

By the way, after years in government communications (code school and copying 5 letter groups), this NG is the first time I ever heard anyone say that 5 letter code groups contained FEC. If its true I wonder why they never taught us that.

Hi

Don't care.
Tim want to teach the programmers: how to write the program, how to
sell it, how to make copy protections and other claptrap from someone
ignoring the shareware's problems (and the sens of humour).
I have explained to him my point of view concerning my software "RadioRaft".
We were not in agreement, so have a look at the result: the disparagement of
my software and me.

Fortunatly I have received hundreds emails or letters with congratulations
about the efficiency of the program, its low price and the service (not a
"customer support" but a kind help: RadioRaft is a hobby for me, not a full
business as this guy thinks).

One said RadioRaft is still the best software in its category: low price
multimode decoder with Hamcomm interface. Try it. There is no equivalent
for Windows, but I'm working for and I'm not alone for the challenge!

73s to all.

Mike,

You may also want to try PSKHell which is a new designer Hell mode. In my view, PSKHell is a MUCH better mode than PSK31 at copying VERY weak DX signals since your brain makes the final decision at which character was actually sent. (With PSKHell, characters are transmitted as IMAGES).

PSKHell also appears to cope MUCH better than PSK31 with multipath fading and polar flutter.

The most popular Hell software was written by IZ8BLY for Windows 95/98 and a sound card. It is FREE!

For information on Hell and the exciting new PSKHell mode, see http://www.qsl.net/zl1bpu You will find links to the software, etc

Source record: 11961

Yes, PSK31 really works. PSK31 does use DSP!!

For most PSK31 programs, the sound card acts as a simple Analogue to digital converter and vice versa. There are a few sound cards that actually do some Digital Signal Processing (or DSP). But most PSK31 programs do not use the DSP capabilities in the sound card since most programs were written assuming that your sound card does NOT have any DSP. (That is a good assumption these days)

Most of the DSP is done by the main CPU in your computer. But you will need a fairly fast computer for most PSK31 sound card programs. The old 386 and most 486 computers will not work.

Most sound card programs for PSK31, SSTV etc assume that your computer is a Pentium 166 Mhz or better.

(If you plan to run another new mode called MT63 in its 2 Khz mode, you will likely need a 500 Mhz computer or better!)

You may also want to try PSKHell which is a new designer Hell mode. In my view, PSKHell is a MUCH better mode than PSK31 at copying VERY weak DX signals since your brain makes the final decision at which character was actually sent. (With PSKHell, characters are transmitted as IMAGES).

Tim,
Excuse Me, But let me see If I've got this right.
You purchase the program.
Next You send unsolicted and uninvited suggestions to the author of the program.

You get a response from the Author.

Then unhappy that the author wasn't overjoyed and lauding over your suggestions, You proceed to suggest to everyone within shot of this newsgroup that they "stay away from this software" and the "nasty, cynical and Hard to Deal with" author.

I would suggest to you, That You.

1) Put the program on your shelf if you don't Like it and just don't use it.

2) Be happy you EVEN recieved a response from the author.

3) And be EVEN HAPPIER it wasn't from his Legal Counsel.

The terms You used and the way you dealt this matter are far more unsavory then any response you could possibly have recieved.

73,
Mike

Software like Digipan for PSK31 will control the PTT through a serial port on the computer directly so you do not need to go through the KAM. If you are running short on COM ports, you might consider add an I/O card to your computer or going the cheap route and get a switch box so you can switch between the TNC and the PSK31 software.

Ok, I'm interested. What FEC algorithm is used with these code groups?
AFAIK code groups are only used to obscure meaning, and don't include
cross products and other redundancies designed to locate and correct
transmission symbol errors as part of their design. Note that I don't doubt
that such error detecting and correcting block coding *could* be done for
CW transmissions, but I've never heard of it actually being done in practice.

CCW technique, which is different from CW, does use fixed clock timing, though
it doesn't use uniform symbol timing (it can't, because the symbols aren't uniform).
The information is still encoded in the symbol edges, which are harder to detect than
the mere presence or absence of signal.

>Also... from a channel coding and modulation viewpoint, CW can easily be
>transmitted using a variety of modulations from FSK to PSK, to whatever. It

>operators, a conversion device to convert back to a keyed tone would suffice
>for human readability.

One of the problems here is the use of the term "CW". Conventionally that
means use of Morse Code by on-off keyed baseband symbols which are
then impressed on a constant carrier by 2T AM modulation. Anything else
is no longer CW. It would be helpful if you are a bit more precise when you
talk about the character encoding, the baseband modulation, or the
transmission modulation so that we can know what you mean.

>Gary despite what you say, CW is truly digital!

No, I disagree. CW encompasses all of the items I listed above.
That is not a digital system. Taken individually, some of the elements
of CW might be considered digital, but taken as a whole CW is not
a digital transmission mode.

>It is so advanced in it's design concepts that it is not even a simple

>coded or turbo coded modulations. What???

Actually, Morse is a quintenary code. It has five symbols, the dot, the dash,
the intracharacter space, the intercharacter space, and the word space.
When conveyed using OOK AM (aka CW), the latter 3 symbols aren't voiced,

and have to be inferred against the noise background. That reduces the probability of correct detection substantially. When Morse coding is used with other modulation forms, such as FSK, all 5 symbols are voiced, and the probability of correct decoding increases.

>Even as CW is conventionally encoded and transmitted this ternary channel

>variable length and comma free. And this was all invented over 150 years
>ago, long before Dr. Shannon was even born and the concepts of source coding
>and channel coding were elucidated in the modern sense. In this respect CW
>is similar to but more efficient than the Varicode that Peter Martinez
>designed for PSK-31...

Varicode is one of the shortcomings of PSK31. It limits the ability to do context free FEC compared to the usage of a uniform length code. The fact that the most used letters are sent with the least amount of transmission symbol information makes the probability of errors higher than for uniform length codes. It does save transmission time, but at the cost of a higher probability of uncorrectable errors. Conventional Morse coding suffers from this same problem, and when used with OOK AM, additionally doesn't voice some of the symbols at all. At least PSK31 voices all of its transmission symbols (one reason it'll work at signal levels where conventional CW operators can't even detect the presence of a signal at all.)

>Gary, if you cannot make intelligent contributions to this thread, I suggest
>that you go back to the "rec.radio.amateur.antennas" NG, you know more about
>antennas than you do digital communications!

You are incorrect. I've devoted much more study to digital communications than I have to antennas.

>And besides, my friend, heh, heh you'r spoiling my fun here on this

That's simply not true. The best known contemporary illustration that it is
not true is PSK31. Time and again operators demonstrate the ability to
work PSK31 signals that are *inaudible* to the ear. PACTOR II also illustrates
the ability of well designed systems to work at signal levels that are as much
as 18 dB below the noise in a 500 Hz rectangular receiver bandwidth. In both
cases, it is the use of matched filter techniques which bring these inaudible
signals up to a positive Eb/No.

Matched filter technique cannot be applied to CW because the waveform
has no a priori known spectrum when unknown text is sent. (If you know the
message that is to be sent, you can form a matched filter for the transmission,
but then if you already know the message contents, the point of receiving it
becomes moot in most cases, EME operations not withstanding.)

>I agree that most CW is conducted using simple OOK, but so what. To be
>fair in a comparison then all other modes should use the same modulation.
>If they can use more advanced modulation, then there is no reason why CW
>cannot do so as well.

If you did, it would no longer be CW. The term CW encompasses the character
encoding, the baseband coding, and the modulation method. Take any one of
those away, and you no longer have CW. But granted that, Morse is still an
edge timing code with non-uniform symbols, and that puts it at a disadvantage
to uniform codes which aren't edge sensitive.

Skilled manual operators do make CW work remarkably well, but that's despite
the method's shortcomings, not because of them. Machine methods, which are
as you say not as powerful in some respects as the human brain, still perform
better because they are used with codes and modulations which are so much
better than CW that the machine's limitations are overcome by the superiority
of the coding and modulation techniques it can use.

It isn't just a matter of cost that has caused commercial and military communications to abandon CW (though the costs of maintainng an adequate CW capability are significant). It is more importantly a matter of performance. CW just isn't as good as some of the more modern techniques.

This isn't "trashing" CW. It is just a recognition of its design limitations. Like analog voice, which has even more severe limitations, we may continue to use CW if we like. But it is a mistake to try to claim for it a superiority that it does not enjoy in fact.

Generally there are share ware programs that won't do as much as the "for
sale" version and sometimes it is difficult to tell the demo from the
shareware version. <:-))

What I dislike are the programs that require the disk to be in the machine
when you run it such as the latest versions of MS Combat flight Simulator
I prefer to put every thing on the Hard Drive.

Fortunately, aside of this traditional "shareware" world, now a "free
software" world is developing. It does not seem to catch on for Windows
yet, but an entire OS plus applications has been written that way.

Partially disabled and/or copy protected software does not exist in this
world. Of course, it is more difficult to get payment for your work,
especially when you are running a small operation.

OK, but that's exactly what YOU are doing. When someone says CW uses
on-off keying and is inefficient, you say CW could easily be applied to
PSK or FSK instead. The fact is that Morse code is used with OOK
99.999% of the time.

You say CW is digital because it is on-off keyed. We can represent
any signal in a digital fashion, though -- that's simply called sampling.
The EPROM repeater ID example just demonstrates that CW can be sampled
like any other analogue signal.

Hamish:

FSK versus OOK.

Low peak to average ratio in the transmission of information is plainly inefficient!

As Dr. Shannon pointed out so many years ago, the most efficient signalling waveforms are those which emulate as closely as possible the characteristics of Gaussian Noise.

Hamish, the peak to average ratio of Gaussian Noise [As measured by the ratio of the mean to the standard deviation.] is certainly not unity, and it is quite high approaching 12 dB or so...

And we see that in all of the most recent and modern digital communications systems with high bandwidth efficiency, from the V.32/V.90 voice band modems to the new ADSL DMT modems, they all use signalling waveforms with very high peak to average ratios. Check it out...

The only thing that low peak to average ratio signals [constant envelope, such as PSK or FSK] have going for them is that they can be efficiently amplified by non-linear amplifiers. Their communications efficiency in bps/Hz stinks! No modern high bandwidth efficiency systems use such simple systems.

Hence OOK, is potentially much more efficient than FSK...

Hope this helps....

Peter ["The CW is digital guy"] K1PO

Yep, or another way to say it is: Because of amplifier maximum dissipation limitations, users of FSK are forced to reduce their power output level by 3dB below their maximum CW output level. When one says it that way, FSK doesn't sound nearly as good, does it? :-)

That's true of FSK but BPSK has a 3dB S/N advantage over OOK and FSK.

So a 50 watt BPSK system gets through as well as a 200w CW system.
(50w + 3dB) = 100w avg = 200w (peak) CW

Well, that happens.

I once found some cracks appearing in the Internet for a newly
released supersoftware, informed the author, and gave my ideas
how to improve...you know...
Guess what?
He was angry at me, so as if I were a criminal and
denied any conversation about this topic...

Enjoy, if you happen to find cracked software,
while even the authors of the programs don't care.

Who cares? This newsgroup is about non Morse Code digital modes. It
is tiresome that frequently a discussion about the various merits of
such modes morphs into a discussion of the virtues of Morse--I guess
because the Morse guys feel threatened in some way.

Hamish:

Sorry, I erred in my statement up the thread, and displayed in the "snippet" below.

[snip]
"> Hamish, the peak to average ratio of Gaussian Noise [As measured by the
> ratio of the mean to the standard deviation.] is certainly not unity, and
it
> is quite high approaching 12 dB or so...
[snip]

Clearly the peak to average ratio [A better measure might be peak to (rms) root mean square ratio.] of "iseal" Gaussian noise in infinite.

What I meant to say was that the peak to rms ratio of Gaussian noise is very high. In fact for practical laboratory Gaussian noise generators it is in the range of 12 - 15 dB.

My point was that for a signalling waveform to be bandwidth efficient (i.e. very high bps/Hz) Dr. Shannon in 1948 that it must approximate the characteristics of Gaussian noise. Indeed all modern high bandwidth efficiency digital communications systems utilize high PAR waveforms.

Hence my point that low PAR or constant envelope signalling schemes like FSK or PSK are not as bandwidth efficient as those with higher PAR...

Now a classical CW transmitter waveform has a much higher PAR than an FSK signal, hence it is potentially more bandwidth efficient (bps/Hz).

Clear?

I'll second that. I enjoy PSK31 very much, but would like to see more Hellscheiber activity. A good place to look is around 14.063. I'm available for skeds if anyone is interested.

I highly recommend the IZ8BLY software. It works very well and is easy to learn.

Shareware is a marketing method, nothing more. The word shareware, contrary
to what some think, does not define how the program works, whether or not
it is copy protected, or what the price is. A $5 program that completely
works, even if you don't pay for it, can be marketed as shareware, as can a
$500 program that requires payment before it's fully functional.

> Fortunately, aside of this traditional "shareware" world, now a "free
> software" world is developing. It does not seem to catch on for Windows
> yet, but an entire OS plus applications has been written that way.

This used to be the case for every other OS too, usually when it was new.
It wears off quickly. Enjoy it while you can.

> Partially disabled and/or copy protected software does not exist in this
> world. Of course, it is more difficult to get payment for your work,
> especially when you are running a small operation.

The era of "open source, everything free for all" linux is coming to a
close. You'll continue to have the small minority who do stuff for free,
because it's fun for them. But it can't go on forever. Eventually, someone
has to pay for the software. Free software is like Communism. Great in
theory, terrible in practice.

2900. Tech question - AM/FM digital radio

Newsgroup: rec.radio.amateur.digital.misc

Cross-posted to:
alt.radio.digital,rec.radio.amateur.digital,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.misc

I'm looking for an answer to a problem that I have had with my last five digital AM/FM stereo pocket radios. All five of them have died the exact same death. Two of them were Radio Shack Optimus radios and three of them were Sony SRF-M32 Walkmans. They all ran on two AAA batteries. The Optimus has a small external speaker (which I never used), and the Sony radio does not. These radios were priced in the $30 to $40 dollar range and performed exceptionally well at first. I used each of these radios for about 3 to 5 hours every day with a variety of quality headphones or earbuds. 95 percent of the time I listened to FM music stations, a lot of the time I had the volume up fairly loud. Battery usage was excellent on all of the radios (using Duracell Ultra's). Now my problem: after about 3 or 4 months each of these radios lost output on the left "speaker". The loss was gradual, but quick, and after a short time the left channel just quit. So of course I am puzzled by this pattern of malfunction. I really need a radio like this for my job, but I don't want to waste any more money. So, first of all, why are my radios konking out like this? And is there a quality pocket digital AM/FM stereo on the market that I can depend on? Thanks in advance for any help.

Martin S. in Arizona.

After wading through 5 years or more of boring posts about the virtues of Morse Code on amateur.policy, I frankly do not welcome more such posts on this forum. Morse Code is not a digital mode as most amateurs use that term. No one can honestly say that this forum is about Morse, is intended to be about Morse, or has ever been about Morse. Just as I do not think it is proper for long posts about pet dogs to be on rec.birds, it is not appropriate for the digital.misc forum to be an outlet for the Pro-Morse line. Just take it somewhere else OM. Please. Tired of having Morse thrown in our faces every time we are trying to discuss something entirely different. It isn't as though the Morse guys ever say anything new. To the contrary, over and over and over about it's the most efficient mode, simple, etc. etc. Just take it to .policy or somewhere (anywhere) else. Please.

Roger:

I am very sorry to tell you this, because your post is so sincere, but...
you are way off base!

This entire thread, and especially my postings, have not been about CW,
rather it has been about digital communications techniques in general.

Including source encoding [data compression for you computer jocks],
channel encoding [computer jocks won't know what that is], modulation
[computer jocks won't know much about that] and the effectiveness of
different signalling waveforms.

CW per se, was used in my postings only as a simple understandable example
of digital signalling from time to time.

IRoger, i you do not chose to, or rather, as I suspect cannot make
intelligent contributions to a technical discussion of digital transmission
techniques, then just point all postings on here with "CW" in the subject
line to your "delete" file.

If however you really want to interact, learn and contribute to a technical
discussion about modern digital communications techniques, then by all means
post away...

I notice that you have not yet made any significant technical contributions
to this thread.

Whereas several others have done so.

Roger, do you have any questions, thoughts, or comments about digital
signalling and digital transmission that you wish to share with us?

Which of the current amateur digital modes do you think are the most
efficient, why, and how would you rate them? What do you mean by efficiency
when rating and comparing digital transmission techniques, etc....?

Best Regards,

Peter [CW is really digital, and we all have a lot to learn from a study
of why it is so effective!] K1PO

Chuck,

There is a PSK31 e-mail list. You can join by sending an e-mail to Majordomo@aintel.bi.ehu.es and putting "subscribe psk31" (no quotation marks) in the body of the e-mail.

I have used several PSK31 programs, including TrueTTY, SBWPSK31 (I think I got that right), Digipan, WinPSK, and Mixw32. Personally, I prefer Digipan and this is what I use most of the time now, but of course this is just my personal preference.

I am running PSK31 with a Kenwood TS-850, and it works very well. I use the Rigblaster interface (http://www.westmountainradio.com) and it works very well. It also works well for other modes such as RTTY, Hellscheiber, SSTV, etc. You can also make your own interface. Basically, connect audio from the rig to the soundcard input. I connect the line-out audio on my Timewave DSP-59+ to my soundcard line-in. You may have to experiment and try the soundcard's mic input to get enough level.

The soundcard output can be connected to the audio input on the 950's accessory connector, but this will not key the rig's VOX. If you connect the soundcard audio output to the mic jack, you should use an attenuator (probably about 100:1) to match the impedance and levels. With the Rigblaster, you can just connect the soundcard output to the Rigblaster, connect the Rigblaster to the rig's mic input, and connect your mic to the Rigblaster. You have the option of PTT keying or serial port keying. I use the serial port keying, although either works fine.

Be careful not to overdrive the transmitter. I run no more than 40 watts output, which is plenty for PSK31. I usually run about 25 watts. You should not drive the transmitter into ALC action.

Let me know if you have any questions or if you need more information. There are plenty of hams using PSK31, especially on 20 meters. If you would like to make a sked, let me know.

BTW, the same interface setup you use for PSK31 also works for several other modes. You might want to check out the Hellscheiber modes; they're also a lot of fun. I recommend the IZ8BLY software (check out http://members.xoom.com/ZL1BPU/Contents.html and http://www.freeweb.org/varie/ninopo/radio/Hell/iz8bly.zip).

Good luck and enjoy!

73,
Jeff, KC1MK

I think you mean that you can connect to your local gateway
on two meters. The "all over the world" part has nothing at all
to do with radio. If you want to talk all over the world, grab
your mike and get on 10/15/20 meters. There you actually
CAN talk all over the world ... using ham radio.

KG7LX runs this configuration on one of his 2M freqs.
One TNC set to 1200 baud, the other to 9600.
People can connect at either baud rate.
TX/RX/PTT each paralleled.

It doesn't seem to bother you that the sounds of your voice go
thru the radio using electrical signals. Why should it bother
me how the signals from my 2m RADIO gateway link get to the
other guy... using ham radio? You just have to look at the
Internet as one big radio.

I realize that this is the wrong group, but I'm hoping someone will see
this and know where I can find a book on this repeater.
I have one of these units in which the receiver "drops out" after a
"warming period". Can anyone help me find a manual and/or schematic?

Actually Glen, you described what I thought was the problem after the first Sony radio started to "die". I was at work listening to some music as usual (volume up too loud for my age), and as I noticed the left side getting weak I really thought that I had either blown out my eardrum or had a large accumulation of ear jam. Went to KMart after work and bought a nifty ear wash kit thingy. After thoroughly douching my ear I tried my headphones with my home stereo and was releived to discover that I was not in fact going deaf as I probably should be from listening to loud headphone music!

Martin.

2912. FS: OptoTrakker Decoder

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-07-06 00:00:00 UTC
From: Bill Crocker <bcrocker@home.com>
Message-ID: <deU85.25327$fR2.235062@news1.rdc1.mi.home.com>
Source record: 11991

FOR SALE:

Like brand new, complete with box, manual, software!
ONLY: $250.00 shipped within the U.S.!

Bill Crocker

Mfg. Site: http://www.optoelectronics.com/optotrakker.htm

The Optotrakker is a communications decoder that when interfaced to a computer, will quickly and easily turn a number of receivers into a trunked radio tracking receiver. The Optotrakker can also interface to virtually any receiver for the decoding of CTCSS, DCS, LTR, Motorola Type I and II, and DTMF, in a non-PC application by displaying data on its two line LCD display.

WHAT CAN THE OPTOTRAKKER DO FOR YOU ?

The Optotrakker used with the supplied TrakkStar Windows software, is the first and only product that can scan multiple types of trunking systems on any frequency band at the same time. The Optotrakker allows you to now scan Motorola 400MHz, 500MHz, 800MHz systems, as well as the 900MHz systems, simultaneously with rapid speed and data capabilities. Using an exclusive pass through technology, interfacing with future receivers will be easy as the Optotrakker requires the use of only one com port. Supports ICOM R7000, R7100, R8500, R9000, R10, AOR AR8000, and AR5000.

Decodes CTCSS, DCS, LTR, DTMF and Motorola talk group ID's
Scan multiple trunked systems simultaneously
All trunked frequency bands supported, including 400MHz, 500MHz, 800MHz, and 900MHz
Interfaces to virtually any receiver when not under computer control
Supplied with TrakkStar Windows trunk decoding software
Built-in Data Slicer for decoding of FSK programs
Two Line LCD display
Interface cables supplied with OptoTrakker

Power 7 - 15VDC
Size 1.8" high x 4.5" wide x 4" deep

Discriminator audio audio modification to receiver may be required.
Software Requirements:
Windows 95 or 98, (Windows 3.11 not supported)
IBM PC compatible, 486/586,
VGA display, mouse and hard drive.
Minimum RAM: 8 megabytes.
One serial port required.

Sounds like the phones sockets were getting contaminated with dirt.
The left channel on a jack plug is usually the tip, so when you insert
the plug into the radio it sometimes carries in a little muck.
Eventually this will build up in the socket and stop the plug tip
making contact. Solution - open the radio case and clean or replace
the headphoones socket.

Hi All,

A couple of questions.

Are there any e-mail lists out there for PSK31? I looked on QTH.NET
and didn't find any.

I downloaded TrueRtty which has PSK31 and I have a Soundblaster 512
Enviroment card. my question is how do i hook up the kenwood 950 for
psk31?

anyone?

I saw this mode of operation and found it amazing!!!!!!!!!!!!

You may want to check out the program Zakanaka for PSK. The list is very active with lots of good info and support for PSK. Zakanaka is free (currently Beta 11) and works very well. This is a full featured sound card type program. It also interfaces with the Logger program (also free) from the same author. Well worth taking a look at!

To subscribe to the Zakanaka Reflector, send a blank

A new Tech call issued to Joaquin Curate.
At least that is what the FCC thinks.

In Reply to: Re: $$How to Make Easy and Fast Money Legally$$ posted by =
j-man on January 16, 1999 at 16:36:37:=20

Now here is how you can make Millions of $$$$s or =A3=A3=A3=A3=A3s or =
any currency in the world!!!=20

PRINT THIS PAGE NOW OR YOU WILL BE SORRY!!!!=20

Now you probably have been scanning different news groups to find out =
which one is the best, haven=91t you? I certainly did. But don=91t leave =
just yet. You=91ve probably seen newsgroups which start =90 I was =
looking through a newsgroup, just like you are now=91 =90I was sceptical =
at first=91 and =90I=91ve spent more than that on lottery tickets=91 I =
have seen many of them around. Asking for you to send $6 and you=91ll =
receive $15,000.=20
Well I=91m asking you to send $10 and receive well over $5,000,000 (5 =
million bucks).
I know it sounds crazy but here is what you have to do. Follow the =
instructions CAREFULLY.=20

1) Get 10 $1 bills and wrap them in separate pieces of paper each saying =
" Add me to your mailing list Please." Also your name and address.=20

2) Put these separate pieces of paper and put them into separate =
envelopes, sending each one to the names below. You should now have 10 =
envelopes with each $1 in and with your name inside.=20

3) Now you need to send this message to 200 newsgroups on the Internet. =
What you do is put your cursor at the top and highlight it all and =
select =90copy=91 then open up =90Word=91 or anything to write on and =
select =90paste=91. Now all you need to do is place your name and =
address on the number 10 spot and move everybody up a place, so 10 =
becomes 9, 9 becomes 8 ect, ect, now knock number 1 off the top, so 2 =
becomes 1.=20

4) Here are the names you need to send the money to.=20

1) R L Enterprises, P.O. Box, 808 Festus, MO 63028, USA=20

2) W.C. Daniels, 5910 Transit Rd. Depew, NY 14043, USA=20

3) Chris Adkins, 127 Cupsaw Dr., Ringwood N.J. 07456 USA=20

4)Simon Belgian, 1212 Viola Ave., Glendale CA, 91202 USA=20

5) Creative Consulting, 4302 N. 16th Ave., Phoenix, AZ 85015 USA=20

6) M L Enterprises 27-1300 King St. E. Box 135 Oshwa Ontario, Canada L =
1H-8J4=20

7) S. Soudakov Elmshurst House Bromsgrove School Worcs B61 7Du England=20

8) S. Kerr 21 Serpentine Rd Selly Park Birmingham B29 7HU=20

9) Ewan MacTaggart 10 Cordingley Close Churchdown Gloucester GL3 2EN =
England.=20

10) Sikhness Enterprises, 441 Avocet Ave. Davis CA 95616 USA

Now this is how it works.=20
As you post this, to 200 newsgroups and people read and think =90 Ah I =
will join up to this.=91 And let=91s say only 5 people reply (a very low =
number)=20
That is $5. Now those 5 people send out 200 news groups and follow the =
instructions as your name is at number 9. Lets say 5 people answer to =
each 200 news groups, then that=91s another $25. Now if they follow the =
instructions carefully, your name is at number 7 and you get $125. Now =
if those 125 people send out 200 news groups you receive $625. And again =
your name moves up to 6 and you receive $3,125. They now post the news =
groups and your name moves up to 5 and those people reply you get =
$15,625. Now this is where the newsgroups I was speaking about earlier =
finish, that=91s it. $6, 6 places. But now your name is now sent out at =
your name at number 4 and you receive $78,125. Your name has still got 3 =
more places to go yet. So now with your name at no 3 you get a whopping =
$390,625. Once again your name moves to 2 and you are going to receive =
$1,953,125 (1 million nine hundred and fifty thousand, one hundred and =
twenty five dollars!!!!!!) But wait, you=91ve got one more place to move =
up. Number 1. You will receive $9,765,625. Can you grasp how much that =
is Nine Million. Oh no, your name had drooped of the list, oh well just =
start again and get some more MILLIONS rolling in. These numbers have =
only been calculated, if only 5 people respond to each 200 newsgroups, =
just think of how many people are on the net!! It has been estimated =
that 20,000 to 50,000 join the Internet every month!

The reason why you must send off the money in the first place is that =
you create a legal service and this is not fraud. If you did NOT SEND =
THE MONEY then you would be committing FRAUD and can be put away, =
because you are using other people=91s name for your own good.=20

Please play fairly and send the money and you will receive tons, in the =
next few weeks!!=20

------=_NextPart_000_0004_01BFE811.9BA91220

A proper job requires some extra circuitry to cross-connect the DCD and
RTS signals internally between the TNCs, so each TNC does not transmit when
the other is already transmitting, or when the other has DCD on.

I would like to know, what possibilities there is to receive many (different
mode)
transmission at the same time in 5kHz (or wider) band?

Now I use skysweeper (www.skysweep.com) for that purpose, but the bandwidth
is limited
in it to 5.5 kHz.

Of course, if there is a probability this might happen.

In the case of KG7LX, there is very little probability that there
will be two connections at the same time ... so the simple setup
works ok, and avoids the problem of modifying the TNCs.

So for trying this out, just hook the wires together and give a try.

The solution Rob suggests can also be done in the node software.

Why do honest differences of opinion arouse such anger and vituperation in otherwise sane people? It seems to me that there is room for everyone in our hobby. If you choose to develop VHF to its fullest then fine. If you wish to do the same with HF then that's fine too.

COOL IT, GUYS

I doubt you'll find a radio to solve this problem; it's built into the very design of mini headphone jacks. The springiness that holds the circuit in place is built into the jack, not the plug (unlike RCA jacks, RJ11s, coax, etc.) The jack is difficult, complicated and expensive to replace, usually requiring soldering.

Annoying enough on a Walkman; they make 'em to die on $300 shortwaves and MP3 players just the same.

The honest solution among manufacturers would be to acknowledge that headphone jacks are really consumable items, and design them to be unscrewed from their sockets, with replacements available at Radio Shack. This will happen with headphone jacks the day it happens with your portable's whip antenna.

Mike,

Let see if I get this right,
You read a newsgroup.
You do not agree with the author.
Next you send unsolicgted and univited suggestions to the author of the
post.

He proably never reads your post because it is buried so far down the
newsgroup, and those who do wonder who died and left you in charge of
morality and protocol.

I would suggest ti you.

1. Log off your ISP.

2. Shut off your computer.

3. Get a life.

Why, because everyone has a right to bitch (including you) about whatever
they want without having to endure soemone else telling them how wrong they
are for doing so.

and to quote you:

"The terms You used and the way you dealt this matter are far more unsavory
then any response you could possibly have recieved."

Depends upon how many receivers/demodulators you choose to operate, all
tuned to the same passband, etc.

I commonly operate PSK31 with a 3.5 KHz passband displayed on my computer
screen in a waterfall display. With my Kachina transceiver, I can display
and copy CW, PSK31, Pactor, etc all simultaneously. Makes quite a unique
set of sounds at times!

Calling Kerry Banke, N6IZW, and Chuck Houghton, WB6IGP. Having just seen this piece in this week's ARRL Newsletter, please tell us more about how you built it and made it work:

~~~~~~

CALIFORNIA GROUP ADDS LASER MODE TO FIELD DAY REPERTOIRE

Participants at the Palomar Amateur Radio Club ARRL Field Day site in Valley Center, California, this year completed a two-way voice contact via laser beam. In typical ham radio tradition, communicating over the nearly 13-mile path on a beam of light involved minimal cost and readily-available parts.

"The first step in establishing a laser QSO is determining that a clear optical path exists," says Bob Gonsett, W6VR, one of those involved in the experiment. Stan Rohrer, W9FQN, at the PARC Field Day site simply "transmitted" a mirror flash to Gonsett, who was on Boucher Hill at Palomar Mountain.

"Flashing this 12.7 mile optical path confirmed that there were no trees, bushes or buildings in the way--constant problems in optical work," Gonsett said. Hams have conducted laser communication over paths of 100 miles or so, he noted, so the distance was not record-breaking. The PARC experiment showed that laser communication can be accomplished with simple, inexpensive gear.

Equipment involved two full-duplex voice-modulated laser units constructed by Kerry Banke, N6IZW, and Chuck Houghton, WB6IGP, using PVC pipe housings. Each uses an ordinary 0.5 mW red "pointer" laser costing less than $3 apiece as a transmitter. The lasers were mounted outside the PVC tubes. "Because a laser beam is very narrow, the apparatus is aimed with the aid of a rifle telescope," Gonsett explained. Precise positioning was accomplished using two micrometers salvaged from microwave tubes.

At the transmitting end, a "stock" pointer laser is powered by a 35-kHz oscillator. A microphone frequency modulates the 35-kHz oscillator at 5 kHz deviation. At the receiving end, the incoming red laser light hits a plastic Fresnel lens that focuses the light onto a photo detector. Out of the photo detector comes the 35-kHz FM signal. That signal is mixed with a 145.000 MHz local oscillator, producing a signal on 145.035 MHz. That signal is run through coax to a ham radio H-T tuned to 145.035 MHz--the H-T serving as the FM demodulator/receiver. The system is full-duplex.

Gonsett said observers at the PARC Field Day site were "blown away" by the brilliance of the one-half milliwatt red laser beam coming from the distant mountain. "While the beam shimmered with atmospheric turbulence, voice communications were clear and steady with only a hint of rumble, thanks to
~~~~~~

the use of FM," he reports.

Hank:

Hey, how are you OM, about time you said something on this subject.

No one on these threads seems to be able to agree on a definition of "digital"!

Maybe you can help.

Some of the commentary on these threads reminds me of apocrophal story about the joint IEEE Section/ACM Section meeting a few years back when an angry EE was heard to say, "we never needed slide rule engineers, why the hxxx do we need computer engineers?"

Hank, you are a well respected expert" in the field of digital communications over radio, with a long history of many contributions to digital radio, especially in the bbs field. I for one have made good use and had a lot of fun using your software and applications with my radios.

You are authoratative because you make real contributions to our grand hobby. Now...

Hank...

What is your definition of "digital" communications?

Does it include communications without computers? i.e. How about folks who run FSK RTTY using Teletype Model 28's? Is that "digital"? What if one uses a computer but only running a terminal emulation program? Was it digital back when everyone on RTTY did it using Teletype Model 15s?

etc...etc...

Is it digital if one uses hunt and peck one finger typing on the "green keys"?

What if they used full ten finger touch typing?

What if they used a Teletype Model 40?

What if they sent Morse by hand into a Morse reader application that "piped" its' I/O stream to a terminal emulator attached to a terminal unit and and HF transceiver, would that be "digital"?

Opinions, thoughts?

Peter [CW is a digital exercise program!] K1PO

Except the Internet is not radio, and it is not a radio. After all this time, radio is special and "magical" because, look 'ma, no wires! That my signal travels from my antenna to that of another ham on the other side of the world using nothing made by man still amazes me. And in order to make efficient and reliable use of radio, one has to learn about and monitor weather--both the terrestrial and solar varieties. It isn't the same as the internet at all, and can't be. For all the touted reliability and ease of internet communications, it doesnt take the place of radio as a science and hobby. It takes the place of the telephone, actually. The internet is wonderful, but it doesnt replace radio--the mistake is that the sole, or even primary goal of ham communications is to talk at will to a specific other person without fading and noise. We are at the "mercy" of the sun and the ionosphere--and glad of it!

: Reply to: relaxn at frontiernet dot net, remove "deletethis".

The problem, as others have noted, is generally the jack....not so much
that it wears out, but that it's terminals get detached from the circuit
board.
In most cases, the jack is only held in place by the soldered connections
themselves(and sometimes by a plastic pin or 2(which do nothing to solve
the real cause of the problem).
Solder is intended to make a electrical connection, not a mecanical one.
(standard solder is WAY too soft to do this well).
Things to do:

1.don't use LONG headphone plugs....they act like a lever, and pull the
jack off the board.(if you are buying a new pair...DON'T get one with a
1/4" plug...the 1/8 adapter is trouble for the same reason.
If you have to use a adapter, use a right-angle one(trust me, it DOES
help).

2. try not to yank the headphone cord....if it is too short, then use
a extentsion cable to lengthen it.

3.if possible, use a headphone with a right-angle plug(or get a
right-angle adapter).

4.get a inexpensive soldering iron, a small pack of solder, and a set of
small screwdrivers, and take the time to learn to resolder the jack
terminals back onto the circuit board...it's NOT that difficult!
A hint:if possible, a bit of contact cement or silicone sealant(urethane
cement should work too) BUT NOT hot-melt glue...it pulls off the board too
easily, and thus becomes useless!), put on the circuit board under the
jack(keep it away from the contacts, of course!) will help anchor the
jack in place, taking some of the stress off the terminals).
Don't use super glues either...too thin, and the fumes can oxidise the
jack contacts.

Btw, some jacks ARE better than others..some of the Sony ones seem better
than most. but they STILL fail quickly at times.

I've resoldered MANY jacks over the years, with excellent results in
almost EVERY case.

It would be better when manufacturers would acknowledge that the design of
the jack plug was not a really good idea, and design a replacement plug
that allows headphone connection without wacky contact.

Unfortunately it is not simple to design better connectors while at
the same time miniturizing them.
And of course manufacturers see very well that a worn-out connector is one
of the first reasons to replace an aging piece of equipment, which they
need to keep their business running.

>In the case of KG7LX, there is very little probability that there
>will be two connections at the same time ... so the simple setup
>works ok, and avoids the problem of modifying the TNCs.

This sort of fixes the problem of transmitting at the same time, but
there still is the problem that 9k6 TNCs usually don't see (or only
erratically see) 1k2 transmissions. So they will step right on top
of them.

For well-performing dual-speed operation on a single channel, everyone
needs to use DCD circuitry that detects any transmission. So no "state
machine DCD", "XR2206 dcd", "9k6 modem DCD" etc.
Best is a simple high-frequency detector at the direct discriminator output
(i.e. a standard FM squelch).

Of course the disadvantage of such a DCD is that it is sensitive to weak
spurious carriers on or near the channel.

>So for trying this out, just hook the wires together and give a try.

>The solution Rob suggests can also be done in the node software.

A decent node uses SCC cards, and the SCC driver I wrote years ago for NET
(and got cloned in many other programs and systems) has a facility to
interlock ports both for transmit and for DCD.

With TNCs this is not really possible, except with 6PACK.

>as low life jerks in Europe by some people.

The difference between Europe and America is that here in Europe a single person doing some programming in his evening hours and selling it via some small distributors is calling himself a hobbyist, while in America he says he is the president of a small company.

Thus, the American customers see him as a professional who should be held liable for any problem and should be harassed when he does not give in. They call him a pain in the neck when that doesn't work.

The problem with computer programming is that it has gone the same way as equipment homebuilding: in the early days of home computers, every owner wrote his own programs. So even when they accomplished very little, they at least had a feeling of what is involved with that.

As the number of computer users has increased, the fraction of users making anything theirselves has steadily dropped, and they become increasingly dependent on a few remaining activists who have to write all the software that keeps their machine ticking. I understand that this can be frustrating at times, but apart from trying to write your own stuff there is little that you can do. (the latter is of course much easier when you use an open-source system for which all sourcecode for the system you are running is on the CD's. then you can try to make a small modification to an existing program, instead of having to start from scratch every time)

It is like wanting to use a computer with soundcard for packet, and having a problem with making the required PTT driving circuit and the cabling: when you don't have the basic soldering skills and equipment, this can be very difficult to achieve. For the radio amateur of 25 years ago, it would have been peanuts.

And of course you can demodulate all PSK31, CW and Pactor signals that
happen to be within the passband at the same time, provided their signal
strength is within a certain limited range.
(no worse than trying to copy any single narrowband signal using a receiver
with a passband that wide)

Since he specifically asked me, I'll reply too ... see above.

The pedantic answer is that it is ALL digital.
The other pedantic answer is that it is ALL analog.

However, he specifically asked what I thought:

There may be any number of digital or analog processing
steps in both transmitting and receiving. These do not matter.

It is the intent of the two parties communicating via radio
that matters. If they think of the data they exchange as
digital, then it is digital, that is, discrete values.

Simple when you think of it that way.

Anyone considering the purchase of a Sony peripheral for their computer might want to give it some further thought. There clearly is not a reciprocal relationship between what they sell and what they service.
-
I purchased a CD-RW drive back in April that just recently went bad (won't read). When I called Sony service, I was told that I could not get a replacement and that I had to ship it across the country to be "repaired" (and we all know what that means...) - with a three (3) week turnaround. Assuming that they keep their 3-week commitment, with shipping both ways, I'd be without the use of the unit for at least five weeks!!!
-
I hardly think that's reasonable or fair.
-
Compare this to HP, who under the same circumstances would simply ship you out a replacement unit and issue a call-tag for the old one.
-
Sony is a behemoth in the marketplace and as such, they have an obligation to scale their service facilities to meet demand. To not do so is an indication of their lack of commitment to customer satisfaction and an unwillingness to stand behind their products.
-
Buyer be ware!

As an alternative to a shared 1200/9600 baud channel with 2 TNC's, why not get a Kantronics KPC-9612? It comes with a special setting to have both data ports share the same radio.

[Of course, this is applicable if one wa asking the question BEFORE acquiring the equipment.....]

Indeed it would be preferable if a more lasting design were introduced. But I was suggesting a mechanism that would preserve backward compatibility.

1/8" jacks were OK for their time...they were on small Sony portable radios at least 35 years ago for occasional use with those ridiculous little thimble-sized one-ear earphones people used back then.

But then they had to come up with a compatible stereo version of the jack/plug, which further tightened the angles, materials and contact surface area. Remember, the design doesn't just have to route the signal, it also has to cut off the speakers.

Nowadays people really stress those jacks with sports use, taping, etc. They're subject to corrosion and metal fatigue.

One way or another, the design needs to be improved, especially on units like the $750 Personal Jukebox.

I've noticed this problem with many of my Walkman portable / pocket AM/FM
radios. Part of the problem seems to stem from poor quality headphone input
jacks. They tend to weaken and loosen to the point where the electrical
contact can be lost inside the jack itself.

The tips below are pretty straight forward, and are sure-fire relief from
this problem.

Thanks
gbowne

One way you could do it without a modem on your laptop is to download an earlier version that is small enough to fit on a floppy (they are all ZIP files), then download one of the update files. I think the only complete (zipped) version of WinAPRS that will fit on a floppy is version 2.2.0. You could then download something like w243updt.zip, and uncompress it on your laptop. The update files are mainly just the executable portion.

When you uncompress the program onto your laptop, don't give it a specific directory to uncompress to. Just tell it to do it to C:\ and the program will automatically create a WINAPRS directory. After you download the updated file, move the older winaprs.exe file to another directory to save it, then unzip the new winaprs.exe.

Of course, when you did not already have the equipment you would buy an SCC
card with two or more modems (e.g. the Baycom model)

Why not get a simple "extension cable" from Radio Shack or wherever that has a 1/8" stereo plug at one end and the corresponding jack at the other end. Plug it into the radio and leave it there - do not stress the radio connectors by removing and replacing it, ad infinitum. Plug your headphones into the cable jack and let that take all the abuse from repeated operation. When the connector starts wearing out, just replace it.

Now, I know that this does nothing to alleviate the problems of using the radio jack to turn the radio speaker on and off. But, if headphone operation only is tolerable, this ploy would at least minimize the wear on the delicate radio connector.

2963. APRS Software

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-07-09 00:00:00 UTC
From: johnl84238@aol.com

I am thinking about playing with APRS....I have the radio and TNC but need to get the software. Can anyone tell me first where I can get the APRS software for
Windows95......and can you tell me how big the APRS program is (bytes) that has to be loaded on my PC.....I want to load it on a laptop which does not have a modem....so I need to do it using floppies to transfer from another PC....I am wondering if that is possible depending on the program size. Thanks for the help.
73,John

You can find it at the www.tapr.org site. Look under APRSSIG. The
latest version there is waprs246.zip, which is 1706528 bytes.

For improved contact while preserving (mechanical) backward compatability,
I once used a thin cable that passes through the hole in the connector,
soldered it internally to the PCB (on a soundcard), then used a set of
european (DIN) speaker connectors to connect the speakers. This solved
an ongoing problem with the ground connection (sound suddenly
"disappearing", all that is left is a differential (R-L) signal at 180 deg
phase.

Title : H-addr/FWD designators

Hello all,
recent msgs originating in Europe and some requests from SysOps to translate
into English language a document (see ref. 4 of attached text), concerning
some notes about 'Forwarding designator elements' written in italian language,
prompt me to collect, and then, studying and synthetizing, the most recent
'official' documentation, with the aim also to revisit and up-to-date our ham
documentation.
I hope to be suceeded in elaborating the present work and that, this might
help someone on the matter and so, as a contribute for all ham-radio
community.

HIERARCHICAL ADDRESSES AND FORWARDING DESIGNATOR ELEMENTS
(A revisited and up-to-dated proposal for packet-radio
*standards* by Gus, i0ojj)

References:
-----------
1. BBS Hierarchical Addressing Protocol - Dave Wolf, WO5H et
al. - August 30th, 1994.
2. International Routing Designators - Jenkins, Lew N6VV et
```

al. - October 1, 1988.
3. Some comments on the Hierarchical Continent Address Designator - Clark, Tom W3IWI - September 22, 1990.
4. Elementi designatori del forwarding (only IT) - Gus Ponza, I0OJJ - 5 February 1998 (up-to-dated and superseded by the present proposal).
5. Working Paper on Creation of Dot-EU Top-Level Domain - European Commission - 2 February 2000 - approved last days also at level of individual Governments of European Union.
6. Countries or areas, codes and abbreviations - revised 16 February 2000 (ISO ALPHA-3 code).
7. Composition of macro geographical (continental) regions and component geographical regions - revised 16 February 2000.
8. Various documentation collected from packet-radio network during about a decade as PBBS SysOp.

Foreword:

The following would be a *further* attempt to define the information that should be placed in the "TO" and the "@" portions of a message.
These info will help to comprise the HIERARCHIAL ADDRESS of a message and consequently it concerns with the correct compilation of forwarding files.

The two types of messages that are discussed here are PERSONAL and BULLETINS.

If it is a Personal message, the first line that is sent may look like |
this: +---+-------------- (S)end the (P)ersonal message
| +------- (TO) IK1GKJ
| | +--- distribute to the PBBS IK1MSL
| | | located in Piemonte region
| | | in ITA
| | | in EUROPE
-+ -----+ +-----------------
example 1: SP IK1GKJ @ IK1MSL.IPIE.ITA.EU

Or, if it is a Bulletin, it may look something like this:
|
+-----+------- (S)end a (B)ulletin
| +-- addressed (TO) anyone interested
| | to (AMSAT) informations
| | +- distribute to the geographic
| | | location (Lazio region)
-+ --+-- +---
example 2: SB AMSAT @ ILAZ

In example 1 the message being sent is Personal and needs a specific GEOGRAPHIC HIERARCHICAL address. The hierarchy of the address is parsed from right to left and identifies the location of the station to whom the message is addressed. The format of that address is as follows:

```
+---- Send Personal +- AF - Africa
| +- NA - NAmerica
-+ +- SA - SAmerica
SP IK1GKJ @ IK1MSL.IPIE.ITA.EU +- AS - Asia
+----- +----- +--- -+- | +- EU - Europe
| | | | +- CONTINENT -+- OC - Oceania
| | | | (see Note 2)
| | | +-- COUNTRY -----+- PRT - Portugal
| | | (see Note 2) +- ESP - Spain
| | +-- REGION +- FRA - France
| | (see Note 1) +- xxx - yyyyyyy
| +-- DESTINATION PBBS CALLSIGN
+---- ADDRESSEE CALLSIGN
```

NOTE 1:

In our italian system, the administrative part (and also a manageable area for packet-radio purposes) wich characterizes a distinct *geographical area* below the *country area* is called Region (there are 20 Regions wich, in some instances, identify also a *call area*) and to wich we can (or *must*) address the forwarding, in a well defined mode, without any possible ambiguity of *geographic route*. See Annex 1.
The just done considerations make clear that adding another field to our r-lines between, PBBS callsign and Region, filled for example with the abbreviation (numberplate) of our (italian) 'provinces' (in many instances a consistent number within each region), prefixed with, or without a '#' sign, besides being useless (unproductive) as per forwarding rule, could be lead also (in general) to an incorrect messages routing.

NOTE 2:

The Country and Continental H designators are *ignored* when the message is in its particular domain. Example: in a msg wich originates inside Lazio region and addressed to a station of the same region, the Nation and Continent designators (.ITA.EU) will be ignored.

Proposal:

The *general* format, wich could be represent almost all over the world realities follows:

+---- Send Personal
-+
sp call @ pbbs.region.state.country.continent
(a) (a) (b) (c) (d) (e)

(a) = valid callsigns as defined by local communications
autority.

(b) = may be a 'Region', an 'Area routing number', a
'Sub-region';
or
any other 'large' Administrative/Postal district
existing *below* the Country, or *below* the
State/Province areas (as defined into the next (c)
note).
This field *MUST* be defined by each Country.

(c) = the names of 'States' or 'Provinces' into wich some
Countries are subdivided. This field is applicable
ONLY for such a systems in wich this situation is
foreseen. Classic situations in wich 'State' or
'Province' applies are, for example: USA 'states',
Canada 'provinces', Mexican 'states', Chinese
'provinces', Brasilian 'states', Australian
'provinces'(?) an so on; for all other countries
this field *must* not exist.
At the risk to be repetitious I guess that, while
the reference to the "State" appear be generally
understood, that for "Province", *not yet*, in
particular, in this context, I would stress the
the concept that we refer to the word "Province" as
that, *exclusively* applicable to those very large
areas as for the above examples and for other
equivalent situations; all other applications are a
very big error.

(d) = the names of 'Countries' or 'Areas' code as per
International Standard ISO 3166-1, Codes for the
representation of names of countries and their
subdivisions-Part 1: Country codes, ISO 3166-1: 1997
(E/F), International Organization on Standardization
(Geneva 1997);
(ST/ESA/STAT/SER.M/49/Rev.4/WWW revised 16 February
2000). See Annex 2.

(e) = the 'Continent' in accordance with 'Composition of
macro geographical (continental) regions and
component of geographical regions' as excerpted from
the United Nations publication in press, also
revised 16 February 2000:

Note: No ISO ALPHA-x code has been foreseen for
Continent's designation into the above

official documentation and others (United
Nations, NATO, EEC, UEO, etc.) as per my own
knowledge.

Code proposed by myself as *standard* for each
'Continent' or 'Particular groups of geographical
Regions' is defined by a *two letter* code.

Africa - (Eastern Africa, Middle Africa, Northern
Africa, Southern Africa, Western Africa).
Code AF

Americas:

North America - (Northern America, Caribbean and
Central America).
Code NA

South America
Code SA

Asia - (Eastern Asia, South-central Asia, South-
eastern Asia, Western Asia)
Code AS

Europe - (Eastern Europe, Northern Europe, Southern
Europe, Western Europe)
Code EU

Oceania - (Australia and New Zealand, Melanesia,
Micronesia, Polynesia)
Code OC

In example 2 the message being sent is a Bulletin. In
Bulletins the hierarchy of the address is expressed in both
the TO (expressing an AREA OF INTEREST) and the @ (expressing
the GEOGRAPHICAL ADDRESS) namely, the portion of the address
wich identifies the DISTRIBUTION AREA.
This will forward using the address found after the @ PBBS
field.

Send Bulletin -+ +----------- TO portion of address
| | wich identifies the
| | AREA OF INTEREST
| |
| | +------- @ portion of address wich
| | | identifies and limits the
+- -----+ +----- GEOGRAPHIC DISTRIBUTION
SB AAAAAA @ DDDDDD

The TO portion identifies the AREA OF INTEREST, which
usually is a topic such as DX, HELP, FBB, SAT, etc. It helps
identify the population of persons who have an interest in
reading the Bulletin.

The @ portion of the message narrows the distribution of the
Bulletin to specific GEOGRAPHIC AREAS (e.g. ITA, ILAZ, IPIE
etc.) and, in a few rare cases to a broad *topical area* (e.g.
SYSOP, AMSAT).

Some examples:

SB HAMFST @ ILAZ advertise ham for a HamFest in Lazio
SB DX @ ITA a DX bulletin for distribution (whole ITA)
SB USERS @ I0OJJ Information for users of I0OJJ PBBS
SB JNOS @ WW for Hams concerned in JNOS (whole world)

The following are examples of the *information* that should
be placed in the TO position of a BULLETIN. They identify the
AREA OF INTEREST (they are proposed from myself as
'standard'):

|ALL All packet stations (see note below)
|TUTTI All packet stations in Italy (see note below)
|????? Every nation useing the equivalent expression
| within its territory (ALLE for DE, TOUS for FRA etc)
|AMSAT Satellites info
|ARI ARI bulletins (an IT ham club)
|ARRL ARRL bulletins (USA ham league)
|BAYCOM BayCom PBBS and pkt terminal info
|CALLS last calls issued from national authority
|CISAR CISAR bulletins (an IT ham club)
|CLUB Club events/meet/etc.
|DX DX reports and info
|EVENT announcement
|FBB FBB PBBS info
|FBB7 7plus msgs about F6FBB server and related utilities
|or
|FBB_7 7plus msgs about F6FBB server and related utilities
| (the same 'formula' as per above examples to be
| applied for all existing SW to be splitted into
| 7plus parts)
|HAMFST Hamfest/flea market info.
|HELP need help, questions
|INFO General information
|JNOS JNOS and related info
|xNOS (for other SW as TNOS, UKNOS etc.)
|KEPS Keplerian Elements (satellites)
|LIST Lists, PBBSs, Nodes, Freqs
|MBLBBS MBL PBBS info
|MAPKEY Index or lists of maps
|MODS re: equipment mods.
|MSYS MSYS PBBS info
|NETWRK packet network info.
|PUBSVC Public service info.
|REBBS AA4RE PBBS info
|RLIBBS RLI PBBS info

```
|RTTY RTTY news
|SAT Satellite info
|SPACE Space News
|SPLIT Generic prg msgs coded in 7plus
|SYSOP For SYSOPS only!
|TCPIP TCPIP information
|TPK TPK prg info
|TSTH TSTHost prg info
|TSTHW TSTHost prg for WIN9x
|WINPAK WinPack prg info
|????? All other packet PBBS/Pkt terminal prgs
|USERS All users of a single PBBS
|VIRUS All news and AntiVirus software
|(to be continued)
+-----------------+--------------------------------------
|
Msg# TSLD Dim To @BBS From Date/Time Title
564146 B$ 9045 SYSOP WW I0OJJ 0619/2327 ROUTINGS

NOTE for ALL (TUTTI) - Use the ALL designation sparingly.
Instead, use the GEOGRAPHIC ADDRESS
along with an AREA OF INTEREST
i.e.: TSTH @ ITA
FBB @ EU
INFO @ ILAZ

The following are examples of the information that should be
placed in the @ BBS position of a BULLETIN. They identify the
GEOGRAPHIC ADDRESS.

|ITA National distribution
|ILAZ For distribution to Lazio Region only
|ROMA For distribution to Province of Rome only
|EU For distribution in EU domain
|WW For distribution all over the world
|USA For distribution in all United State of America
|FRA For distribution in France
|AMSAT National AMSAT info.
|
|(to be compleded for each country area)

If you use WinZip or PKZip software for compression you can split your 1.7 meg file between two floppy disks. I did it for field day for the laptops there.

I looked at Tim's web page and found out he is a programming in basic. This explains everything. Basic programmers are know-it-alls, but they are clueless when it comes to programming.

Both parties are at fault. Tim should stop being a know-it-all (he's probabaly a know-it-all ham too, like many of you are), and Franï¿½ois should just thank him for his input and toss it in file 13.

2969. Digital HF station for sale

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-07-10 00:00:00 UTC
From: Luther Williams <z3f3q3mh@coastalnet.com>
Message-ID: <kdda5.11905$Q7.771965@news-east.usenetserver.com>
Source record: 11856

Hello and thanks for reading,

I have a digital HF station for sell. It consists of :
Kenwood TS-690SAT (10-160M plus 6M)
with mounting bracket, DC power cord and mike
orininal double boxes and manual, AEA PK-232 MBX ,
Y2K windows software(pactor, rtty, and etc.) cables,
MFJ tnc/mic switchbox, astron 35 amp power supply,
bugcatcher HF mobile 10-80M antenna with short and
tall mounting post. KW swr/power meter sw-2000. I
am selling this as a package for $1000.00 obo. plus
shipping.

I also have a HAL PCI-4000 Clover-11 TNC (pactor,
rtty and etc.) It does not need an irq and takes a psa slot
in the pc. I want $ 325.00 and I'll ship.

You can check my reference user name n1nnm on ebay.

Thanks,

Luke N1NNM

2970. FA: Hamcomm/JVFAX Digital Demodulator with Software

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-07-10 00:00:00 UTC
From: TimG <fewtchNOfeSPAM@yahoo.com.invalid>
Message-ID: <y0BqOSF4EGzuxR0FdNIES55t8U8Y@4ax.com>

For Auction:

Hamcomm/JVFAX (etc.) demodulator (comparator) with REGISTERED
Radioraft v3.2 software. Use with a receiver or transceiver and a PC
to decode RTTY, CW, ASCII, FAX and many other digital modes on the HF,
VHF and other radio bands.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=376745837

This auction ends July 17 at 12:51:17 PDT. Reasonable reserve price
-- if you're interested in digital transmissions on HF and VHF, I
invite you to put your bid in. Check my feedback profile on Ebay and
bid with confidence.

Enjoy,

Tim

I like Will's position. I too feel the "magical" element of global communication without using wires. I enjoy being at the "mercy" of natures interactions of sun and ionosphere.

I also see a cultural element in this topic. Communication via the internet implies a total dependence on society with the subjugation of the individual in the act. No one can communicate from point A to point B via the internet without tens of thousands of other people showing up to work, keeping the multi billion dollar network humming. The internet communicator hits the carriage return key which in turn grovels to the Internet Service Provider for permission to have the puny little packet transported over the behemoth. The sender of the information can take about as much pride in completing the communication as he can in forcing the sun to rise in the east each morning.

Point to point radio communication on the other hand is more an expression of rugged individualism. The radio operator is in control of the communication process and only needs the cooperation of the receiving party to complete the transaction. Entire societies can rise and crumble without impacting two individuals communicating via radio.

Which of these two would give you something to feel pride in?

Once the radio is made (or bought), sure. But creating the radios
in the first place is as dependent on the efforts of others
(e.g. semiconductor manufacturers) as communication over the
Internet. So is supplying the power to make them run.

This is a pretty interesting thread for me. I have been a ham since I was 13 and have spent most of my professional career in digital communications, most recently (the last 15 years) as a co-founder at Qualcomm.

In principal, OOK (CW) ought to be poorer in performance than PSK in a Gaussian channel by a few dB. But we have anecdotes claiming that human operators can match the performance of some of the digital modes. How do we reconconcile this? One way is to consider that "in principal" didn't consider the whole system involved in human decoded Morse. In fact there IS an FEC system in Morse CW. It's called the English (or whatever you speak) language. There is considerable redundancy in the language and additional redundancy on the context. A skilled human "decoder" can take advantage of all this context and code and wring more out of a given situation than one might suspect. In addition to FEC coding, there is feedback coding available. CW traffic handlers developed methods for detecting errors and asking for "fils" to make corrections. A further aspect of the system is rate adaptation. The transmission speed can be adjusted to take advantage of or accommodation to temporary changes in channel conditions.

I disagree with the notion that Morse CW is not or cannot be a digital system. The key idea in what makes a digital system is that the modulation system defines a number of discrete symbols that are sent. Morse CW certainly qualifies on this count. Additionally, I have no problem conceiving of a machine implemention of Morse CW that is every bit as digital as the other modes which we have no problem accepting as digital. Fully implementing all the implicit codes would be quite a challenge, however.

Actually, we use FEC all the time in ham communications, i.e., the phonetic alphabet. If one wishes to have an explicit FEC code in Morse CW, it is a simple matter to encode the messages (mentally, it you like) into the phonetic alphabet and transmit them this way. And it is also a simple matter for the skilled human operator to mentally perform the error detection and correction function. Does this work as well as convolutional encoding/Viterbi decoding? Of course not. But it does function as a FEC system, and one that can be implemented by incredibly simple means.

By the way, I think that Morse CW is a binary modulation system (not ternary or whatever). There are two signalling elements: transmission of a dot length pulse, and a dot length silence. Everything else can be described as a simple code combining sequences of these elements. The code has certain rules, such as that there are no two dot long

pulses transmitted. This may sound pedantic but it is the way you begin to describe how you would build an optimum receiver for Morse CW. And yes, one can build a practical matched filter system for Morse CW. Just because people usually don't doesn't mean one can't do it.

I'm not trying to start arguments here, just bringing another perspective.

Not to mention smelting the copper to make the telephone wires,
melting and spinning the glass to make the fiber backbone, mining
bauxite for the aluminium for your antenna, etc.

But these things have nothing to do with the topic at hand, except
in a minor way several steps removed. Nobody I know ever built
a radio station "from scratch". At a minimum they counted on
someone else to mine the copper ore, smelt it, and draw the wire.

What radio amateurs do that the general public cannot do
is combine various things in such a way they can be used to
communicate with other radio amateurs. Those things are not just
radios, antennas and other physical objects; they are also the
protocols, standards and experience needed to make communications
channels do useful work.

The general public can in fact use the telephone and the internet.
So doing those things is not "doing ham radio."

But this is all too complex and esoteric for some hams, who seem
to think that talking over the internet is "ham radio"!

That sounds like the most reasonable description to me...

It looks like pulse radar with poor leading and trailing pulse edges :-)

Al Gore did. And he invented the Internet.

You missed the point entirely George.

Point: Using ham radio is no purer than using the Internet since both
rely on someone else's technology...
